# Executive Summary

---

This report presents the results of the Local Transportation Analysis (LTA) conducted for the proposed Amazon Distribution Center development at 2791 W. Winton Avenue in Hayward, California. Amazon would occupy an existing 507,000 square-foot warehouse to operate an Amazon Delivery Station. Access to the site is provided by three driveways on Winton Avenue.

The potential project related transportation deficiencies were evaluated in accordance with the standards and methodologies set forth by the City of Hayward. The study analyzes the transportation deficiencies caused by the proposed development on the key intersections in the vicinity of the site during the weekday AM and PM peak hours of traffic.

In addition, the study includes a queuing analysis, a review of site access and circulation, an evaluation of potential impacts to transit services and pedestrian and bicycle facilities, and parking.

## Project Trip Estimates

The project is estimated to generate 4,151 daily vehicle trips, with 299 trips occurring during the AM peak hour and 695 trips during the PM peak hour.

## Local Transportation Assessment (LTA)

The results of the Local Transportation Analysis (LTA) show that the following study intersections would operate at an unacceptable conditions during the PM peak hour under all scenarios:

- Cabot Boulevard and West Winton Avenue
- Clawiter Road and SR 92 eastbound ramps/Eden Landing Road

The addition of project trips would cause the critical movement delay to increase by more than 5.0 seconds at these intersections. Thus, the project would have an adverse effect on operations at these intersections.

## Recommended Improvements

The results of the peak-hour traffic signal warrants checks indicate that the Cabot Road/Winton Avenue intersection would not meet the signal warrant. The intersection does not satisfy parts A and B of the traffic signal warrants analysis under either peak hour. However, level of service at this intersection would be improved to satisfactory levels with the installation of a traffic signal under all conditions.

The results of the peak-hour traffic signal warrant checks indicate that the Clawiter Road/SR 92 Eastbound Ramps/Eden Landing Road intersection would meet the signal warrant under all conditions.

The installation of traffic signals at the Cabot Boulevard/West Winton Avenue and Clawiter Road and SR 92 eastbound ramps/Eden Landing Road intersections would improve the level of service at these intersections to satisfactory levels. According to the City of Hayward Traffic Study Interim Guidelines, when a project results in an impact or signal warrants being met at a study intersection, the project must make a fair share contribution to the cost of improvements. Based on the impacts or traffic signal warrants being met, the project contribution would be 100% at these intersections.

The extension of the northbound left-turn pocket at the intersection of Clawiter Road/Winton Avenue by 50 feet into the existing two-way left turn lane would accommodate both the existing and project left turn volumes. This can be accomplished by re-striping the existing two-way left turn lane.

## Transit, Pedestrian and Bicycle Analysis

The proposed project does not conflict with existing or planned pedestrian and bicycle facilities. The transit service within the immediate vicinity of the project site operates well below capacity, and additional trips generated by the proposed project could be accommodated by existing bus services. Therefore, the impacts to pedestrian, bicycle and transit facilities would be less-than significant. The project should re-stripe West Winton Avenue between Cabot Boulevard and the Bay Trail entrance to include a Class III Bicycle Boulevard, which is an improvement consistent with the City's Bicycle and Pedestrian Master Plan.

There are no existing sidewalks leading to the Bay Trail. Currently, there is low traffic volume in this area of West Winton Avenue. However, more development could increase the amount of traffic in this area. The project should contribute to future construction of sidewalks that provide pedestrian access to the Bay Trail.

## Freeway Segment Analysis

The freeway study segments operate at LOS E or better during the AM and PM commute peak hours under existing conditions. The proposed project would not result in any potentially significant impact to any of the freeway study segments under 2020 plus project conditions.

## Freeway Ramp Capacity Analysis

At the I-880 and Winton Avenue interchange under Existing and Existing Plus Project, all ramps have a volume to capacity (V/C) ratio that is below 1.0, which means that the existing traffic demand is lower than the ramp capacity.

## Freeway Ramp Queuing Analysis

At the Clawiter Road/SR 92 Eastbound Ramps and Industrial Boulevard/SR 92 Westbound Ramps intersections, both freeway off-ramps have sufficient capacity to serve the existing traffic queues.

# 1. Introduction

---

This report presents the results of the transportation analysis (TA) conducted for the proposed Amazon Distribution Center development at 2791 W. Winton Avenue in Hayward, California (see Figure 1). Amazon would occupy an existing 507,000 square-foot warehouse to operate an Amazon Delivery Station. Access to the site is provided by three driveways on Winton Avenue (see Figure 2).

## Scope of Study

The purpose of the study is to identify potential transportation adverse effects related to the proposed development. The potential adverse effects of the project were evaluated in accordance with the standards and methodologies set forth by the City of Hayward. An analysis of vehicle queuing, site access and on-site circulation, parking, and transit, bicycle, pedestrian access, and vehicle miles travelled (VMT) is also included.

The study analyzes the traffic adverse effects of the proposed development on the key intersections in the vicinity of the site during the weekday AM and PM peak hours of traffic. Locally, the AM peak hour of traffic is usually between 7:00 AM and 9:00 AM, and the PM peak hour is typically between 4:00 PM and 6:00 PM. It is during these periods that the most congested traffic conditions occur on an average weekday.

## Study Intersections

The study includes those intersections that provide primary access to the project site and intersections that would experience a traffic increase of 10 or more peak-hour trips per lane. These intersections were selected in consultation with City of Hayward staff. The study intersections are listed below and shown on Figure 1.

1. West Winton Avenue and Cabot Boulevard (All-Way Stop)
2. West Winton Avenue and Corsair Boulevard (Signalized)
3. West Winton Avenue and Clawiter Road (Signalized)
4. West Winton Avenue and Hesperian Boulevard (Signalized)
5. West Winton Avenue and Southland Drive (Signalized)
6. Clawiter Road and Depot Road (Signalized)
7. Depot Road and Cabot Boulevard (Two-Way Stop)
8. Clawiter Road and SR 92 Westbound Ramps – Breakwater Avenue (Signalized)
9. Clawiter Road and SR 92 Eastbound Ramps – Eden Landing Road (All-Way Stop)
10. Industrial Boulevard and Depot Road (Signalized)
11. Industrial Boulevard and SR 92 Westbound Ramps – Cryer Street (Signalized)
12. Industrial Boulevard and SR 92 Eastbound Ramps – Sleepy Hollow Avenue (Signalized)
13. Hesperian Boulevard and Depot Road – Cathy Way (Signalized)

## Study Freeway Segments

1. I-880 south of Winton Avenue
2. I-880 north of Winton Avenue
3. SR 92 west of Clawiter Road
4. SR 92 east of Clawiter Road

## Study Freeway Ramps

1. Southbound On-Ramp from eastbound Winton Avenue
2. Southbound On-Ramp from westbound Winton Avenue
3. Southbound Off-Ramp to westbound Winton Avenue
4. Southbound Off-Ramp to eastbound Winton Avenue
5. Northbound Off-Ramp to westbound Winton Avenue
6. Northbound Off-Ramp to eastbound Winton Avenue
7. Northbound On-Ramp from eastbound Winton Avenue
8. Northbound On-Ramp from westbound Winton Avenue

The following Metropolitan Transportation System (MTS) roadway segments on Winton Avenue and Hesperian Boulevard were analyzed.

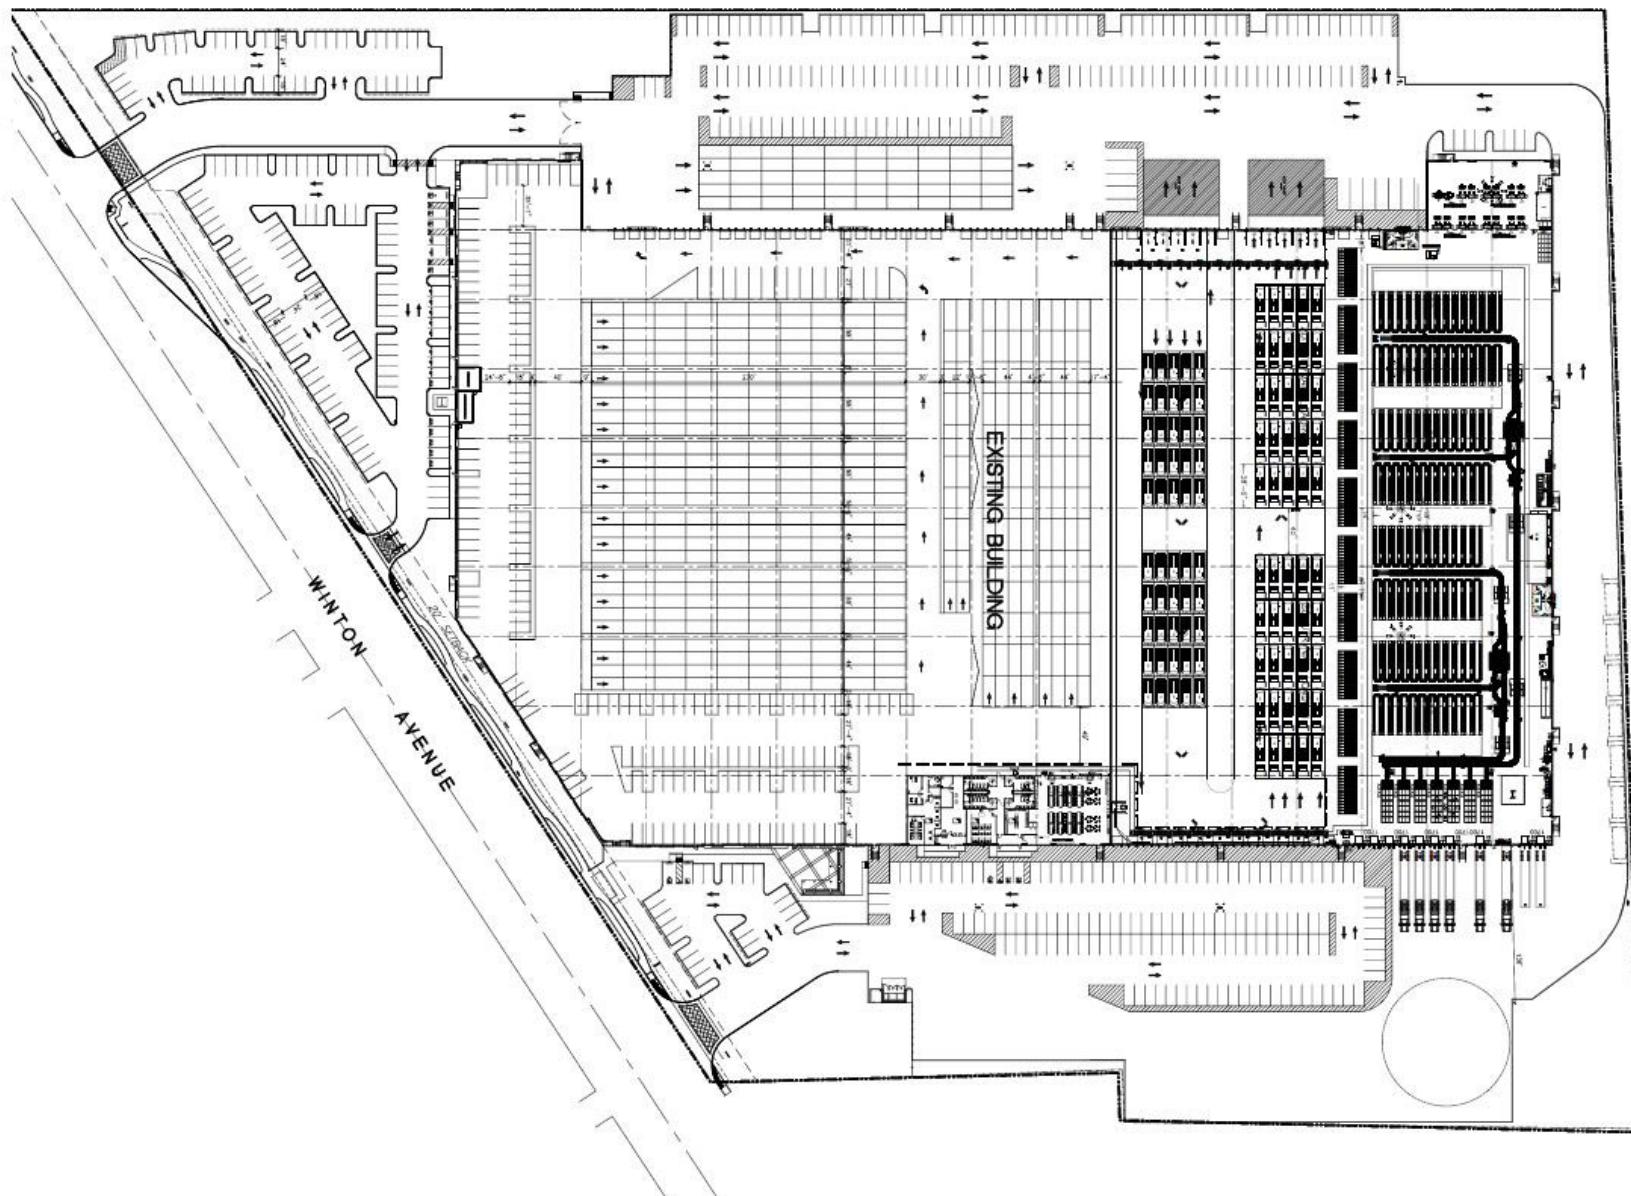

1. Winton Avenue between Cabot Boulevard and Clawiter Road
2. Winton Avenue between Clawiter Road and Hesperian Boulevard
3. Winton Avenue between Hesperian Boulevard and I-880
4. Hesperian Boulevard north of Winton Avenue
5. Hesperian Boulevard south of Winton Avenue

2791 W. Winton Ave - Amazon

**Figure 1**  
**Site Location and Study Intersections**

2791 W. Winton Ave - Amazon

**Figure 2**  
**Site Plan**

Intersection traffic conditions were evaluated for the following scenarios:

- **Existing Conditions.** Existing AM and PM peak-hour traffic volumes were obtained from turning-movement counts taken from the 2595 Depot Road traffic study and previous traffic studies conducted between February 2016 and September 2019. Since some of the counts are older than two years old, a one percent growth factor, consistent with forecasts from the Hayward General Plan Update model, was applied per year to 2020 to account for growth in traffic volumes. Due to COVID-19 Shelter-in-Place, typical traffic conditions have changed. With more people working from home, people are less inclined to drive to work. Existing 2020 volumes are much lower than normal conditions as a result and are not historically consistent. As such, previous/historical numbers with an applied growth factor was used to account for typical traffic volumes.
- **Existing Plus Project Conditions.** Existing plus project traffic volumes were estimated by adding to existing traffic volumes the additional traffic generated by the project. Existing plus project conditions were evaluated relative to existing conditions in order to determine potential project related adverse effects.
- **Background Conditions.** Background traffic volumes were estimated by applying a growth factor of 1% per year for the next 5 years to existing conditions to represent traffic growth in the area. The growth factor was derived from the 18% projected growth rate between the Year 2000 to Year 2020 in the Hayward General Plan Update travel demand model.
- **Background Plus Project Conditions.** Background plus project conditions represent background peak hour traffic volumes with the addition of project traffic. Background plus project conditions were evaluated relative to background conditions in order to determine potential project related adverse effects.
- **Cumulative Conditions.** Cumulative traffic volumes were estimated by applying a growth factor of 1% per year through year 2040 to represent traffic growth in the area. The growth factor was derived from the Hayward General Plan Update travel demand model.
- **Cumulative Plus Project Conditions.** Cumulative plus project conditions represent cumulative peak hour traffic volumes with the addition of project traffic. Cumulative plus project conditions were evaluated relative to cumulative conditions in order to determine potential project related adverse effects.

## Other Transportation Issues

The study includes a queuing analysis, a review of site access and circulation, an evaluation of potential impacts to transit services and pedestrian and bicycle facilities, and parking.

## Methodology

This section presents the methods used to evaluate traffic conditions at the study intersections and the traffic impacts of the project. It includes descriptions of the data requirements, the analysis methodologies, and the applicable level of service standards.

## Data Requirements

The data required for the analysis were obtained from previous traffic studies and the City of Hayward. The following data were collected from these sources:

- Existing traffic volumes,
- Existing bicycle facilities,

- Existing transit services, and
- Lane geometries

### **Intersection Level of Service Methodology and Standards**

Traffic conditions at the study intersections were evaluated using level of service (LOS). Level of service is a qualitative description of operating conditions ranging from LOS A, or free-flow conditions with little or no delay, to LOS F, or jammed conditions with excessive delays. The various analysis methods are described below.

#### **Signalized Study Intersections**

The City of Hayward level of service methodology for signalized intersections is the *2010 Highway Capacity Manual (HCM)* method. The study intersections were evaluated with a level of service analysis using SYNCHRO software in accordance with the *2010 Highway Capacity Manual* methodology. The Hesperian Boulevard/Depot Road intersection was evaluated with a level of service analysis using SYNCHRO software in accordance with *2000 Highway Capacity Manual* methodology due to the shared and exclusive lane geometrics that cannot be supported by the HCM 2010 methodology. The 2010 HCM operations method evaluates signalized intersection operations on the basis of average control delay time for all vehicles at the intersection. As stated in the City of Hayward General Plan Goal M-4.3, the City of Hayward level of service standard for signalized intersections is LOS E or better during peak commute periods except when a LOS F may be acceptable due to costs of mitigation or when there would be other unacceptable impacts, such as right-of-way acquisition or degradation of the pedestrian environment. The correlation between average control delay and level of service is shown in Table 1.

**Table 1**  
**Signalized Intersection Level of Service Definitions Based on Average Control Delay**

Level of Service	Description	Average Control Delay Per Vehicle (Sec.)
A	Operations with very low delay occurring with favorable progression and/or short cycle lengths.	Up to 10.0
B	Operations with low delay occurring with good progression and/or short cycle lengths.	10.1 to 20.0
C	Operation with average delays resulting from fair progression and/or longer cycle lengths. Individual cycle failures begin to appear.	20.1 to 35.0
D	Operations with longer delays due to a combination of unfavorable progression, long cycle lengths or high V/C ratios. Many vehicles stop and individual cycle failures are noticeable.	35.1 to 55.0
E	Operations with high delay values indicating poor progression, long cycle lengths, and high V/C ratios. Individual cycle failures are frequent occurrences. This is considered to be the limit of acceptable delay.	55.1 to 80.0
F	Operations with delays unacceptable to most drivers occurring due to over saturation, poor progression, or very long cycle lengths.	Greater than 80.0

Source: Transportation Research Board, *2000 Highway Capacity Manual*, (Washington, D.C., 2000)

## Unsignalized Intersections

Level of service at unsignalized intersections was based on the *2010 Highway Capacity Manual* (HCM) method using the Synchro software. This method is applicable for both one-way and all-way stop-controlled intersections. The correlation between average control delay and LOS for unsignalized intersections is shown in Table 2.

**Table 2**  
**Unsignalized Intersection Level of Service Definitions Based on Control Delay**

Level of Service	Description	Average Delay Per Vehicle (Sec.)
A	Little or no traffic delay	10.0 or less
B	Short traffic delays	10.1 to 15.0
C	Average traffic delays	15.1 to 25.0
D	Long traffic delays	25.1 to 35.0
E	Very long traffic delays	35.1 to 50.0
F	Extreme traffic delays	greater than 50.0

Source: Transportation Research Board, *2000 Highway Capacity Manual* (Washington, D.C., 2000) p 17-2.

## Traffic Signal Warrants

The unsignalized study intersections of West Winton Avenue and Cabot Boulevard, Depot Road and Cabot Boulevard, and Clawiter Road and SR 92 Eastbound Ramps-Eden Landing Road were analyzed for potential signalization based on the Peak-Hour Volume Signal Warrant, (Warrant #3 – Part B) described in the California Manual on Uniform Traffic Control Devices (MUTCD), 2014 Edition. This method provides an indication whether peak-hour traffic volumes are, or would be, sufficient to justify installation of a traffic signal. Intersections that meet the peak hour warrant are subject to further analysis before determining that a traffic signal is necessary. Other options such as traffic control devices, signage, or geometric changes may be preferable based on existing field conditions.

## MTS Freeway and Roadway Segments

Operation of the Metropolitan Transportation System (MTS) freeway and surface street segments were assessed based on volume-to capacity (V/C) ratios. For freeway segments, a per-lane capacity of 2,200 vehicles per hour was used. For surface streets, a per-lane capacity of 1,100 vehicles per hour was used. This methodology is consistent with the approach used for other projects within Alameda County. These capacities do not reflect additional capacity provided at intersections through turn pockets. Roadway segments with a V/C ratio greater than 1.0 are assigned LOS F. Volume-to capacity ratios and the corresponding levels of service are shown in Table 3.

**Table 3**  
**Level of Service Criteria for Freeway and Roadway Segments**

Level of Service	v/c <sup>1</sup>
A	<= 0.60
B	0.61 to 0.70
C	0.71 to 0.80
D	0.81 to 0.90
E	0.91 to 1.00
F	> 1.00

Source: Transportation Research Board, 2000 Highway Capacity Manual, <sup>1</sup>Volume to Capacity ratio

### Adverse Effects at Signalized and Unsignalized Intersections

According to the City of Hayward standards, a development is said to create an adverse effect on traffic conditions at a study intersection if for either peak hour:

1. The level of service at a signalized intersection degrades from an acceptable LOS E or better under no project conditions to an unacceptable LOS F under project conditions, or
2. A signalized or unsignalized intersection operates at LOS F without the project, and the addition of project trips causes the average control delay to increase by 5.0 seconds or greater.

### Metropolitan Transportation System (MTS) Roadway Analysis Methodology

According to the Alameda County Transportation Commission's (ACTC) 2011 Congestion Management Program (CMP), the LOS standard for MTS roadway segments is LOS E, except where LOS F was the LOS of a segment when originally measured as part of the CMP, in which case the standard shall be LOS F. However, the ACTC does not have a policy for determining a threshold of significance for segments operating unacceptably without the project. Rather, professional judgment is required to determine project level impacts.

Therefore, for the purposes of this traffic impact analysis, an adverse effect would be identified when the project traffic causes an MTS network segment to fall from an acceptable LOS E or better (roadway segment, freeway segment, or freeway ramp v/c ratio of 0.99 or less) in the No Project case to an unacceptable LOS F (v/c of 1.00 or more); or, if a segment is already operating at LOS F in the No Project case, the v/c ratio increases by more than 0.02 (for example, from 1.03 to 1.05).

### Intersection Vehicle Queuing Analysis

The analysis of intersection levels of service was supplemented with a vehicle queuing analysis at intersections where the project would add a substantial number of trips to the left-turn movements. The intersection queuing analysis was conducted using SYNCHRO traffic analysis software in accordance with the 2010 *Highway Capacity Manual* methodology. SYNCHRO provides total movement delay and 95<sup>th</sup>-percentile queues for each movement.

## 2. Existing Conditions

This chapter describes the existing conditions for transportation facilities in the vicinity of the site, including the roadway network, transit services, pedestrian and bicycle facilities, and traffic operations at the study intersections.

### Existing Roadway Network

Regional access to the project site are provided by I-880 and SR 92. Local access to the project site is provided via West Winton Avenue, Cabot Boulevard, Corsair Boulevard, Clawiter Road, Hesperian Boulevard, Southland Drive, Depot Road, and Industrial Boulevard.

**Interstate 880 (I-880)** is a north-south freeway extending from Oakland to San Jose. In the vicinity of the project I-880 provides four mixed-flow lanes in both directions, with one HOV lane in each direction.

**SR 92** is a four- to six- lane east-west freeway extending from Half Moon Bay in western San Mateo County to Hayward in Alameda County. Access to and from the project study area is provided via interchanges at Clawiter Road, Industrial Boulevard, and Hesperian Boulevard.

**West Winton Avenue** is a west-east arterial street that extends from Depot Road in the west to Grand Street in the east. West Winton Avenue has two to four lanes of travel and has a posted speed limit of 35 mph. West Winton Avenue has sidewalks on both sides of the street with a few exceptions where the sidewalk is discontinuous. Within the vicinity of the project, West Winton Avenue is a Class III bike route from Depot Road to Clawiter Road. On-street parking is permitted along West Winton Avenue between Bush Lane and Clawiter Road.

**Cabot Boulevard** is a north-south roadway that extends from its north end near Barrington Court to Depot Road in the south, where it transitions to Whitesell Street. Cabot Boulevard has four lanes and has a posted speed limit of 35 mph. Within the vicinity of the project, Cabot Boulevard has sidewalks on both sides of the street. Cabot Boulevard is a Class III bike route between West Winton Avenue and Depot Road. Cabot Boulevard provides access to industrial and commercial developments. On-street parking is prohibited on both sides of the street.

**Corsair Boulevard** is a north-south roadway that extends from its north end near Stearman Avenue to West Winton Avenue in the south. Corsair Boulevard has four lanes of travel and has a posted speed limit of 25 mph. Corsair Boulevard provides access to industrial and commercial developments.

**Clawiter Road** is a north-south collector street that extends from West Winton Avenue in the north to Arden Road in the south. Within the vicinity of the project, Clawiter Road is two- to four-lanes wide and has a prima facie speed limit of 25 mph. Clawiter Road has sidewalks on both sides of the street with a few exceptions where the sidewalk is discontinuous. Clawiter Road is a Class III bike route from West Winton Avenue to Arden Road. On-street parking is prohibited along Clawiter Road.

**Hesperian Boulevard** is a north-south arterial street that extends from East 14<sup>th</sup> Street in San Leandro in the north to Alameda Creek in the south, where it transitions to Union City Boulevard. Hesperian Boulevard is six lanes wide and has a posted speed limit of 35 mph. Hesperian Boulevard has sidewalks on both sides of the street. On-street parking is prohibited. Within the vicinity of the project, Hesperian Boulevard has no bike facilities.

**Southland Drive** is a six-lane north-south roadway that becomes a four-lane roadway at its 90-degree bend. Southland Drive extends from West Winton Avenue in the north to Hesperian Boulevard in the west. Southland Drive has sidewalks on both sides of the street when oriented in a north-south and no

sidewalks when Southland Drive is oriented in a west-east direction. Southland Drive has a prima facie speed limit of 25 mph with no bicycle facilities. On-street parking is prohibited.

**Depot Road** is an east-west collector street that extends from Hesperian Boulevard in the east to its terminus near the San Francisco Bay. Within the vicinity of the project, Depot Road is two lanes wide and has a posted speed limit of 25 mph. Depot Road is a Class III bike route and has sidewalks on both sides of the street. On-street parking is permitted on both sides of the street.

**Industrial Road** is a north-south arterial street that extends from Clawiter Road in the north to Hesperian Boulevard in the south. Within the vicinity of the project, Industrial Road is four lanes wide and has a posted speed limit of 35 mph. Industrial Road is a Class III bike route and has sidewalks on both sides of the street. On-street parking is prohibited along Industrial Road.

## Existing Bicycle Facilities

The bicycle facilities in the vicinity of the project (see Figure 3) consist of shared bike routes (Class III bikeway). Bike routes are existing streets that accommodate bicycles but are not separate from the existing travel lanes. Routes are typically designated only with signs. Class III bicycle routes are present on Cabot Boulevard between West Winton Avenue and Depot Road, Depot Road between Cabot Boulevard and Hesperian Boulevard, Clawiter Road between West Winton Avenue and Arden Road, and Industrial Boulevard between Clawiter Road and Industrial Parkway.

## Existing Pedestrian Facilities

Sidewalks are generally found on both sides of all previously-described roadways in the study area in the immediate vicinity of the site, except on West Winton Avenue and Clawiter Road where sidewalks are discontinuous in places. All signalized study intersections have pedestrian crosswalks and curb ramps.

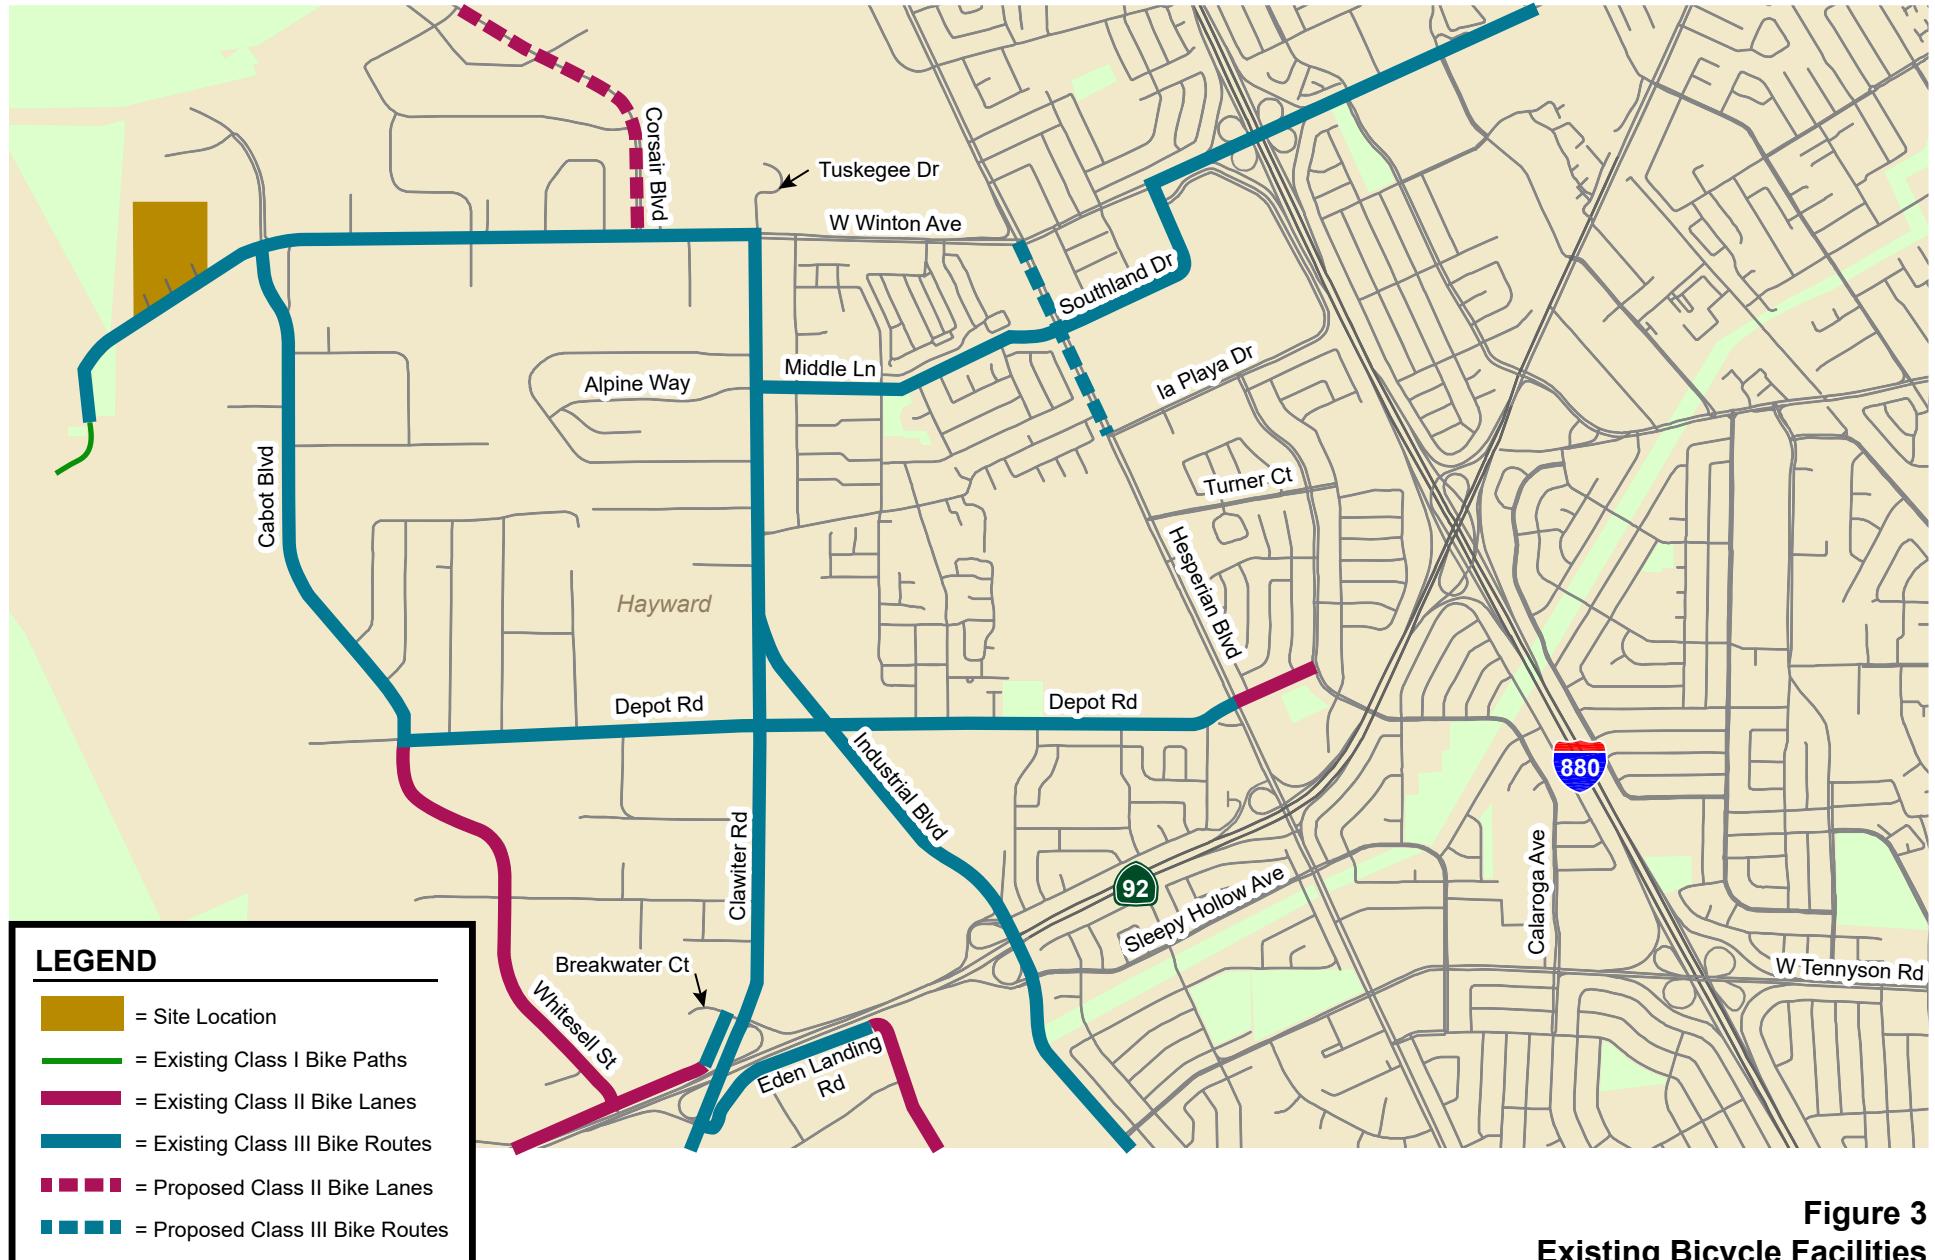

Although all the signalized study intersections have crosswalks, some of them lack crosswalks on some of the legs. At the Corsair Boulevard/Winton Avenue intersection, there is no crosswalk on the east leg of the intersection. At the Hesperian Boulevard/Depot Road intersection, there is no crosswalk on the north leg of the intersection. At the Industrial Boulevard/SR 92 West On-Ramp/Cryer Street intersection and the Industrial Boulevard/ SR 92 East On-Ramp/Sleepy Hollow Avenue intersection, there are no crosswalks on the north and south legs of the intersection.

## Existing Transit Services

Existing bus service in the project vicinity is provided by the Alameda-Contra Costa Transit District (AC Transit). There is one bus route in the area, described below. Existing transit service is shown in Figure 4.

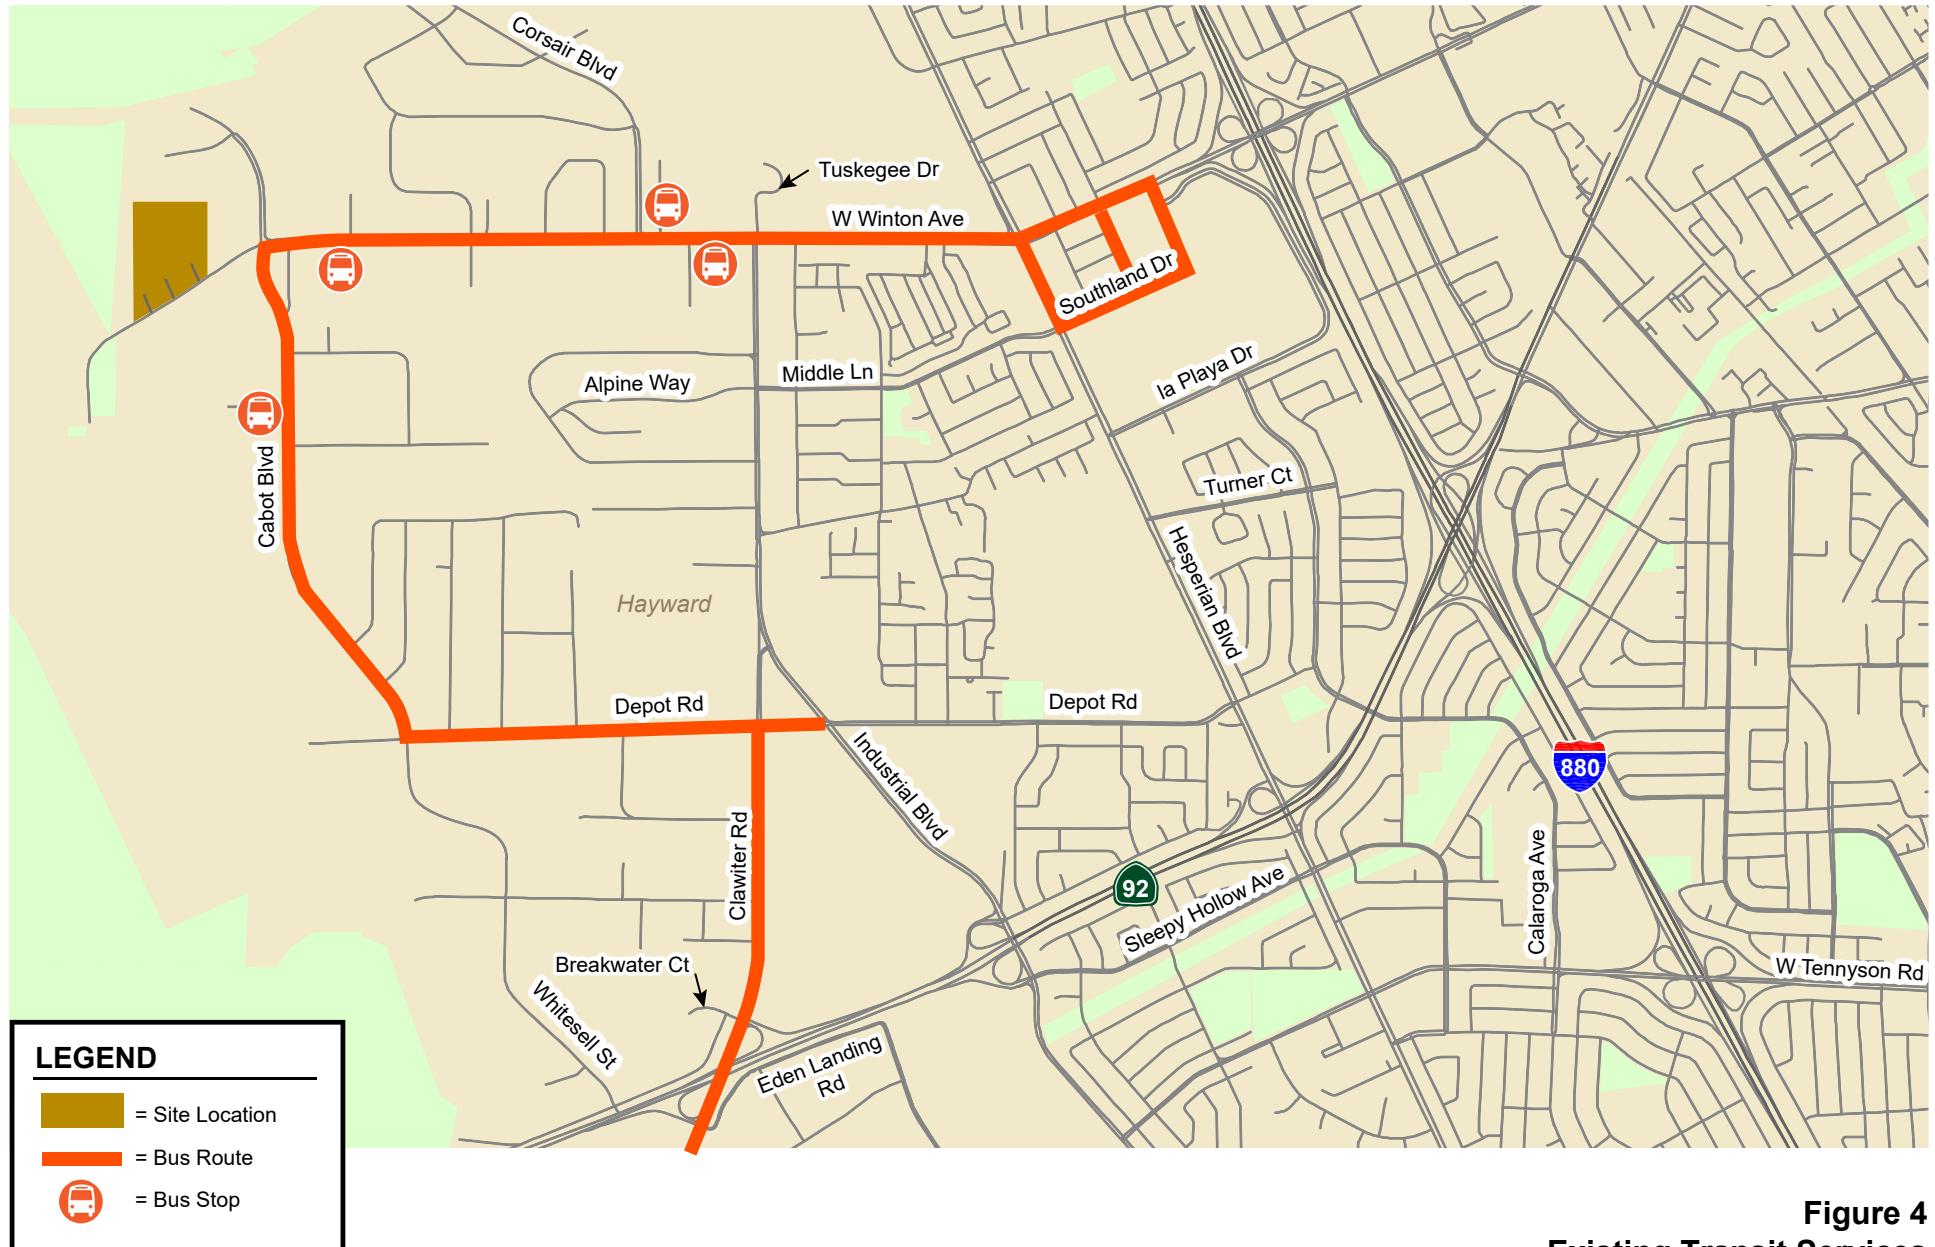

**Local Route 86** provides service between the Hayward BART station and the South Hayward BART station. Route 86 operates along Cabot Boulevard and West Winton Avenue in the project study area, with 30-minute headways during the weekday peak commute hours and 45-minute headways during the weekends. The closest bus stop is located on West Winton Avenue near Cabot Boulevard approximately one quarter mile from the project site.

## 2791 W. Winton Ave - Amazon

**Figure 3**  
Existing Bicycle Facilities

## 2791 W. Winton Ave - Amazon

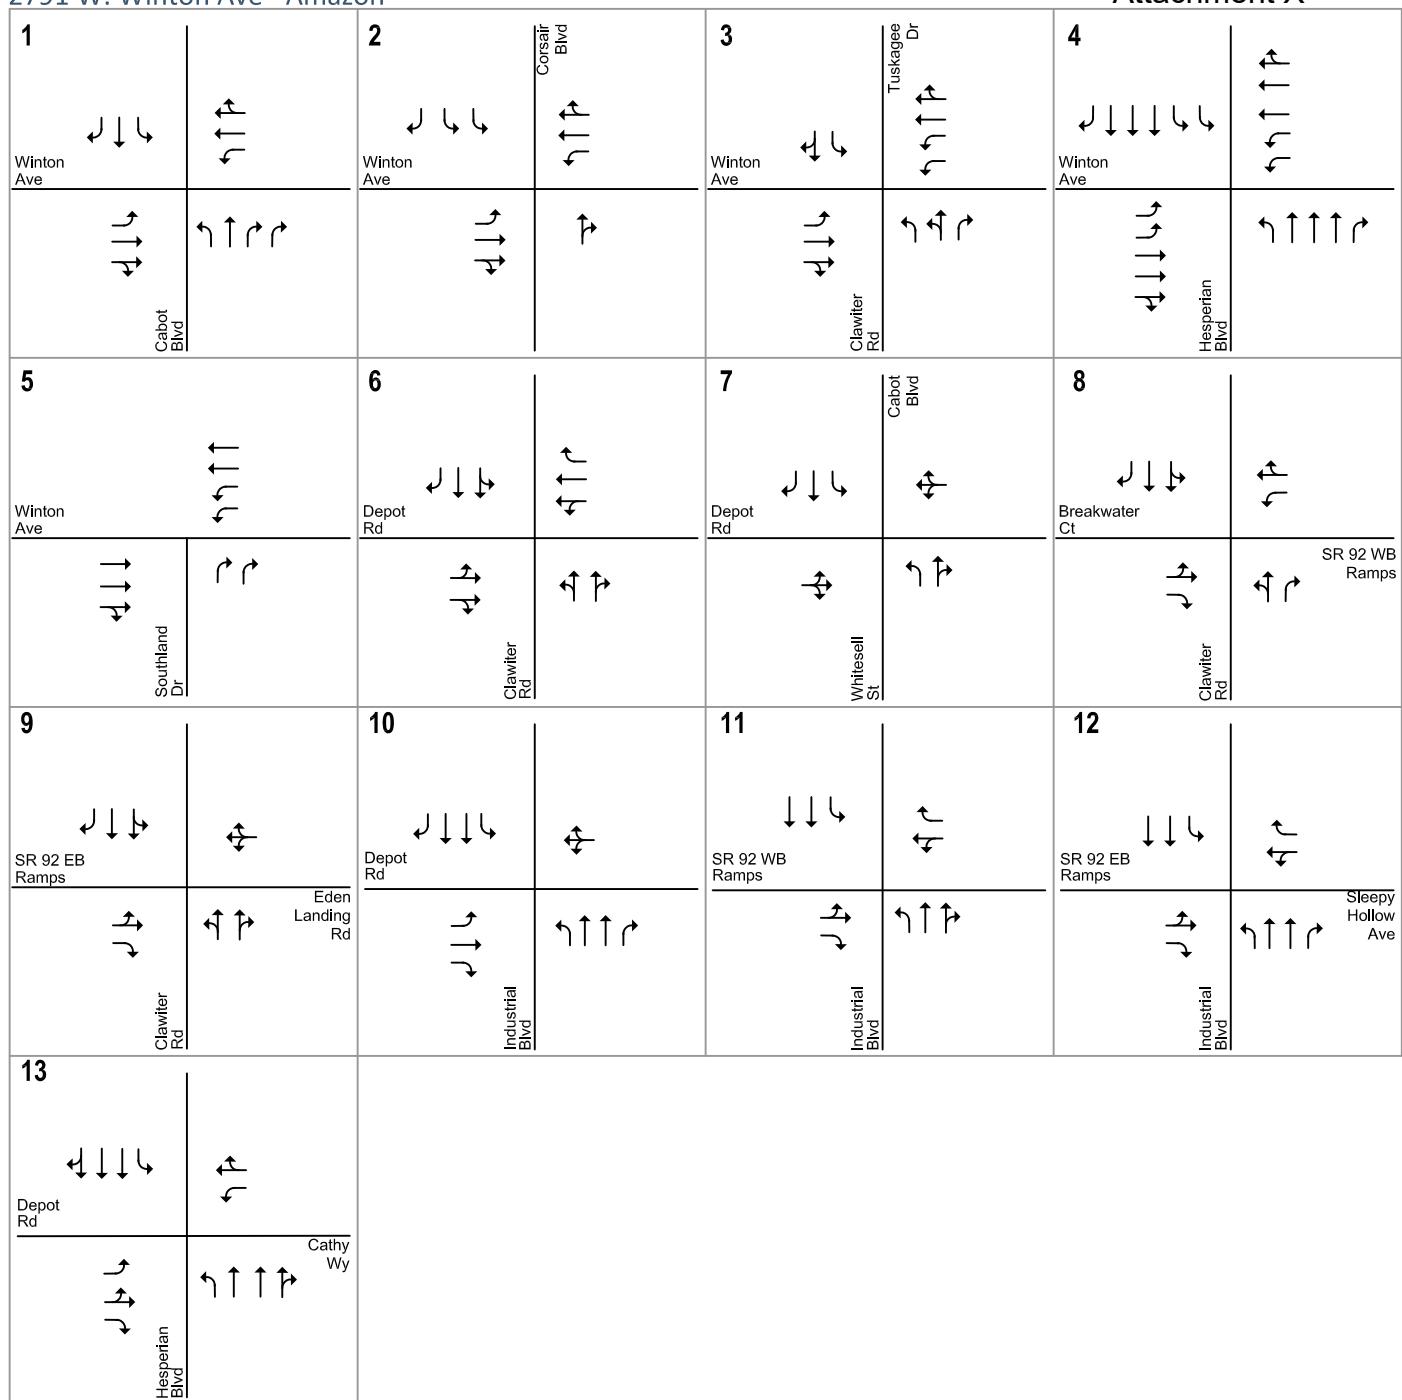

**Figure 4**  
Existing Transit Services

## Existing Lane Configurations and Traffic Volumes

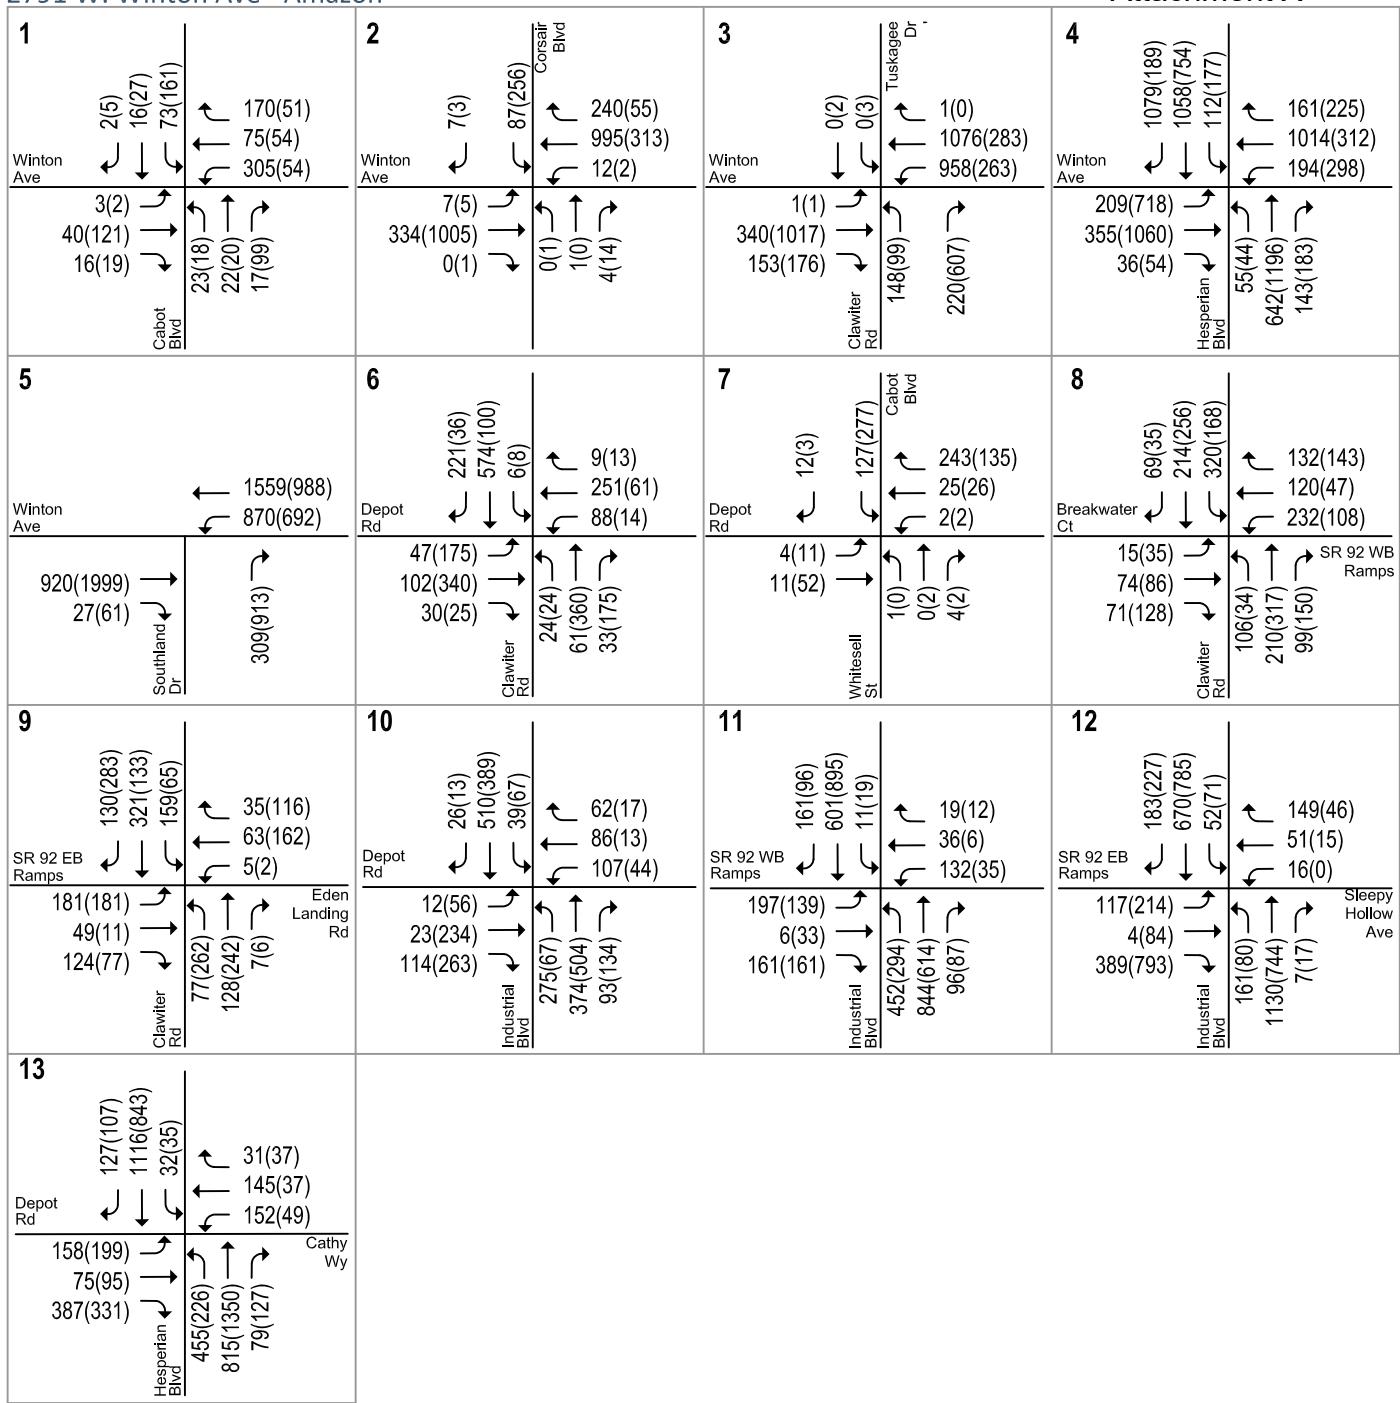

The existing lane configurations at the study intersections were obtained from previous traffic studies (see Figure 5).

Existing peak-hour intersection volumes (see Figure 6) were obtained from previous traffic studies. The counts were collected between February 2016 and September 2019, between 7:00 and 9:00 AM and between 4:00 and 6:00 PM. A growth factor of 1% per year was applied from the previous count date to estimate 2020 volume.

The intersection turning-movement counts conducted for this analysis are presented in Appendix A. Traffic volumes for all components of traffic are tabulated in Appendix B.

**Figure 5**  
**Existing Lane Configurations**

**LEGEND**

XX(XX) = AM(PM) Peak-Hour Traffic Volumes

**Figure 6**  
**Existing Traffic Volumes**

## Existing Intersection Levels of Service

Intersection levels of service were evaluated against the City of Hayward level of service standards. The results of the intersection level of service analysis show that most of the study intersections operate at acceptable level of service during both AM and PM peak hours (see Table 4). The intersection of Clawiter Road and the SR 92 eastbound ramps operates at an unacceptable level of service during the PM peak hour.

The intersection levels of service calculation sheets are included in Appendix C.

**Table 4**  
**Existing Intersection Levels of Service**

#	Intersection	Control	Peak Hour	Count Date	Note	Existing	
						Avg. Delay (sec)	LOS
1	Cabot Boulevard & West Winton Avenue	All-Way Stop	AM	02/11/16		14.1	B
			PM	02/11/16		11.4	B
2	Corsair Boulevard & West Winton Avenue	Signal	AM	03/30/17	*	7.6	A
			PM	03/30/17	*	11.3	B
3	Clawiter Road & West Winton Avenue	Signal	AM	02/11/16	*	21.4	C
			PM	02/11/16	*	49.1	D
4	Hesperian Boulevard & West Winton Avenue	Signal	AM	02/03/16		36.9	D
			PM	02/03/16		51.5	D
5	Southland Drive & West Winton Avenue	Signal	AM	03/30/17	*	27.3	C
			PM	03/30/17	*	66.5	E
6	Clawiter Road & Depot Road	Signal	AM	09/12/19		13.0	B
			PM	09/12/19		14.5	B
7	Cabot Boulevard & Depot Road	All-Way Stop	AM	03/30/17		9.8	A
			PM	03/30/17		11.8	B
8	Clawiter Road & SR 92 Westbound Ramps/Breakwater Avenue	Signal	AM	07/18/17	*	42.4	D
			PM	07/18/17	*	35.1	D
9	Clawiter Road & SR 92 Eastbound Ramps/Eden Landing Road	All-Way Stop	AM	07/18/17		20.6	C
			PM	07/18/17		86.9	F
10	Industrial Boulevard & Depot Road	Signal	AM	09/12/19		12.1	B
			PM	09/12/19		14.2	B
11	Industrial Boulevard & SR 92 Westbound Ramps/Cryer Street	Signal	AM	09/12/19		40.2	D
			PM	09/12/19		29.8	C
12	Industrial Boulevard & SR 92 Eastbound Ramps/Sleepy Hollow	Signal	AM	09/12/19		47.9	D
			PM	09/12/19		56.3	E
13	Hesperian Boulevard & Depot Road/Cathy Way	Signal	AM	09/12/19	*	72.6	E
			PM	09/12/19	*	38.1	D

**Notes:**

\* indicates the intersection level of service is calculated using the HCM 2000 module with the Synchro software. These intersections have unusual lane geometries that cannot be supported by Synchro HCM 2010 module.

**BOLD** indicates a substandard level of service

## Existing Roadway and Freeway Segment Levels of Service

The analysis methodology used to analyze roadway facilities is described in Chapter 1. The level of service was determined by comparing existing traffic volumes for selected roadway and freeway segments with hourly traffic capacities. Table 5 and Table 6 shows the results of the LOS analysis of MTS roadway segments and freeway segments for the 2020 analysis scenario without the proposed project. 2020 volumes were obtained from the Alameda Transportation Commission's Countywide

Travel Demand Model. As shown, all the study segments are operating at LOS E or better during both the AM and PM peak hours under 2020 baseline conditions.

### 3. Existing Plus Project Conditions

---

This chapter describes existing plus project traffic conditions with the addition of the traffic that would be generated by the proposed project. Existing plus project traffic conditions could potentially occur if the project were to be occupied prior to the other approved projects in the area.

#### Roadway Network under Existing Plus Project Conditions

The roadway network under existing plus project conditions would be the same as the existing roadway network because the project would not alter the existing intersection lane configurations.

#### Project Trip Estimates

The magnitude of traffic produced by a new development and the locations where that traffic would appear were estimated using a three-step process: (1) trip generation, (2) trip distribution, and (3) trip assignment. In determining project trip generation, the magnitude of traffic traveling to and from the proposed project site was estimated for the AM and PM peak hours. As part of the project trip distribution, the directions to and from which the project trips would travel were estimated. In the project trip assignment, the project trips were assigned to specific streets and intersections. These procedures are described below.

##### Trip Generation

Through empirical research, data have been collected that quantify the amount of traffic produced by many types of land uses. The research is compiled in the Institute of Transportation Engineers' (ITE) *Trip Generation Manual, 10<sup>th</sup> Edition* (2017). The rates published for High-Cube Fulfillment Center Warehouse (Land Use 155) were used to estimate the trips generated by the proposed project. The ITE does not provide in/out percentage split for High-Cube Fulfillment Center Warehouse. Therefore, it is assumed that 50% of the trip generation rate will enter and 50% of the trip generation rate will exit. ITE results were found to be consistent with Amazon's operational model. In addition, ITE rates were found to be slightly more conservative than data provided by Amazon. As such, ITE rates were used for the purposes of this analysis.

As shown in Table 7, the project is estimated to generate 4,151 daily vehicle trips, with 299 trips occurring during the AM peak hour and 695 trips during the PM peak hour. These trips include the line haul trucks and delivery vans. The estimated number of line haul trucks and delivery vans are based on Amazon's operational model and can be found in Appendix E.

**Table 7**  
**Project Trip Generation Estimates**

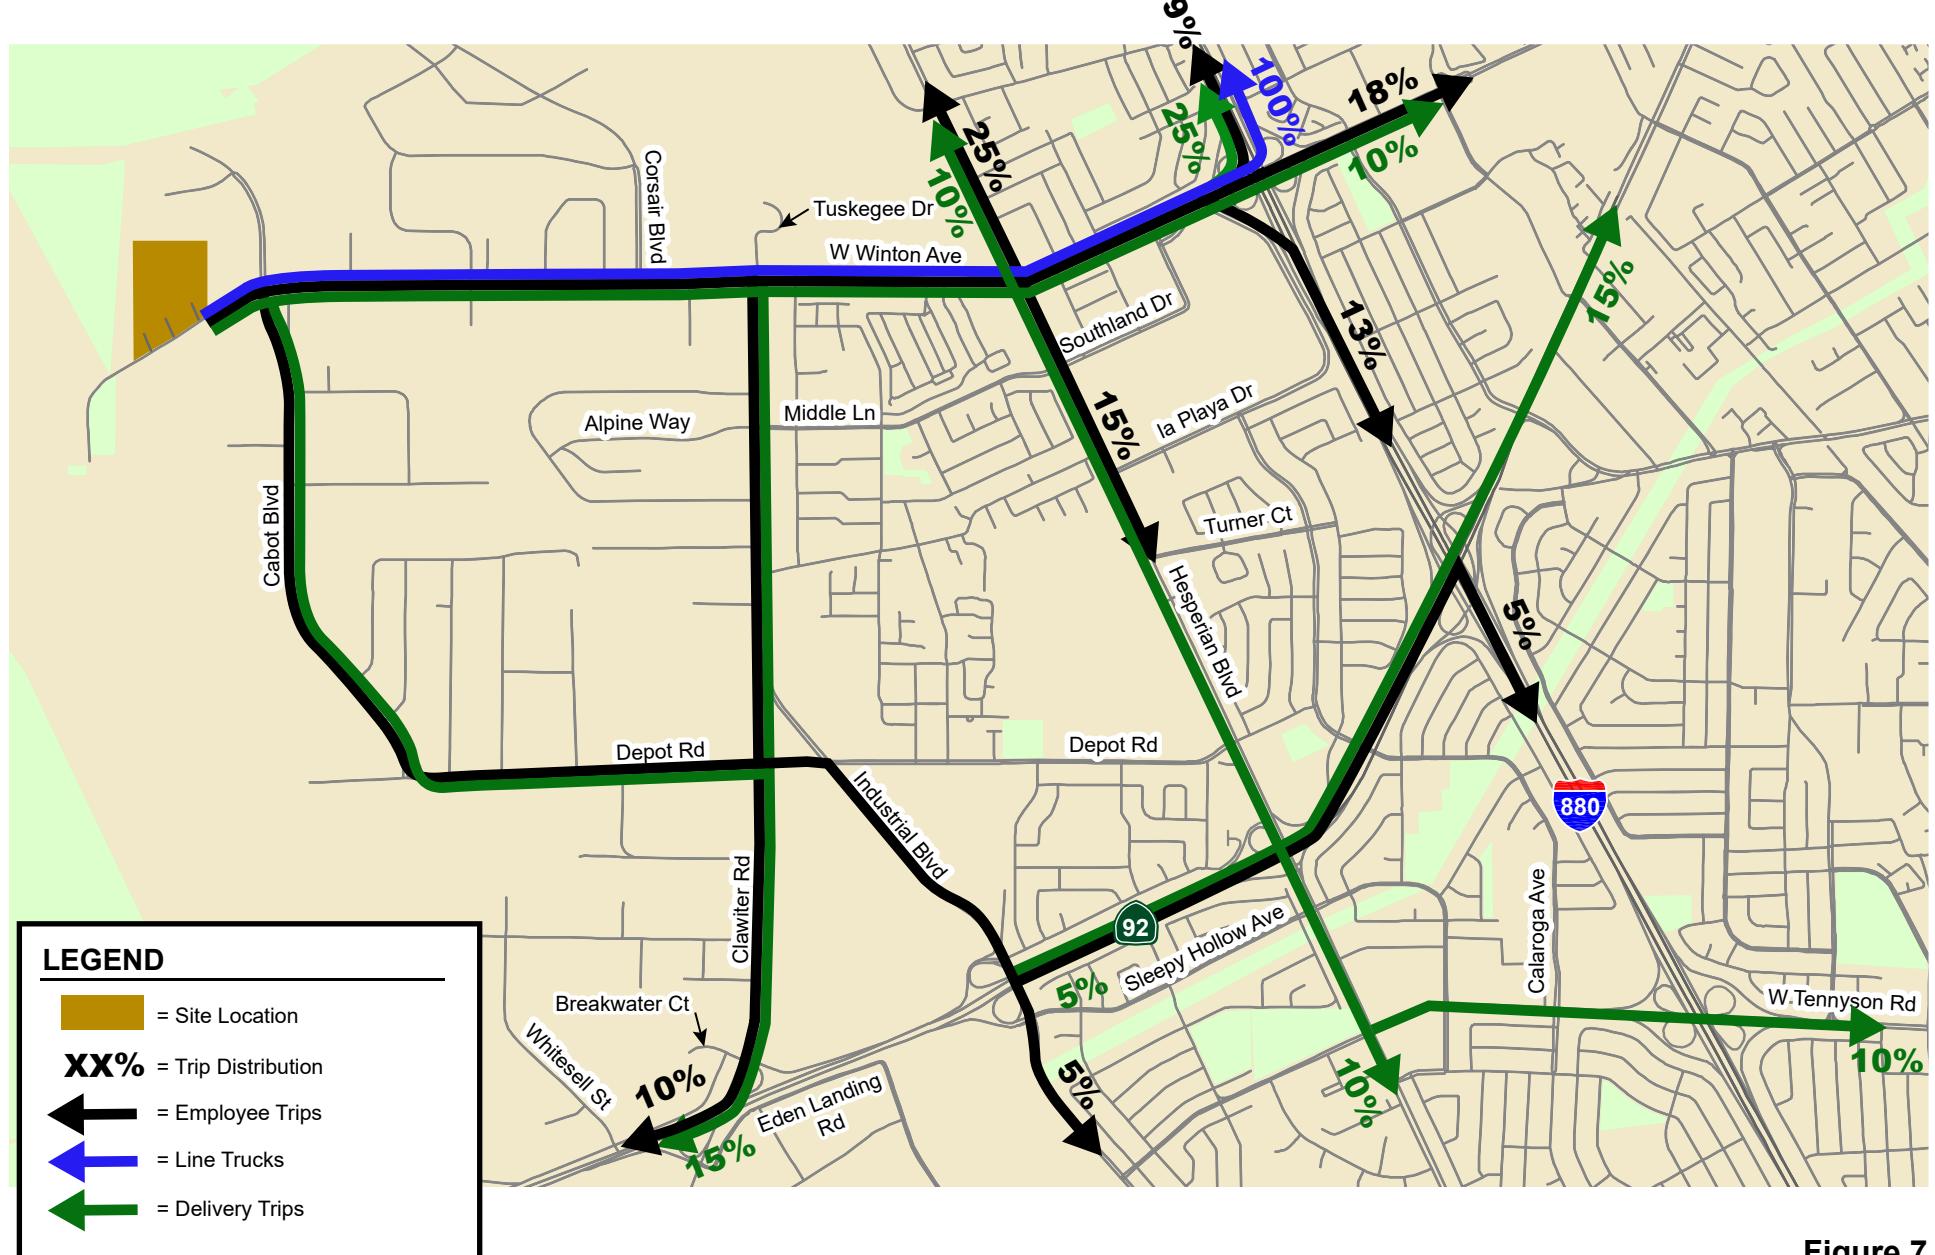

ITE Land Use Code	Size	Daily		AM Peak Hour			PM Peak Hour					
		Rate	Trip	Rate	In	Trip Out	Total	Rate	In	Trip Out	Total	
<b>Proposed Uses</b>												
Warehouse <sup>1,2</sup>	155	507,500 Square Feet	8.18	4,151	0.59	150	149	299	1.37	348	347	695
<b>Notes:</b>												
<sup>1</sup> Land Use Code 155: High-Cube Fulfillment Center Warehouse (average rates expressed in trips per 1,000 s.f.)												
<sup>2</sup> ITE does not provide the in/out percentage split for High-Cube Fulfillment Center Warehouse. It is assumed that 50% of the trip generation rate will enter and 50% of the trip generation rate will exit.												

## Trip Distribution and Assignment

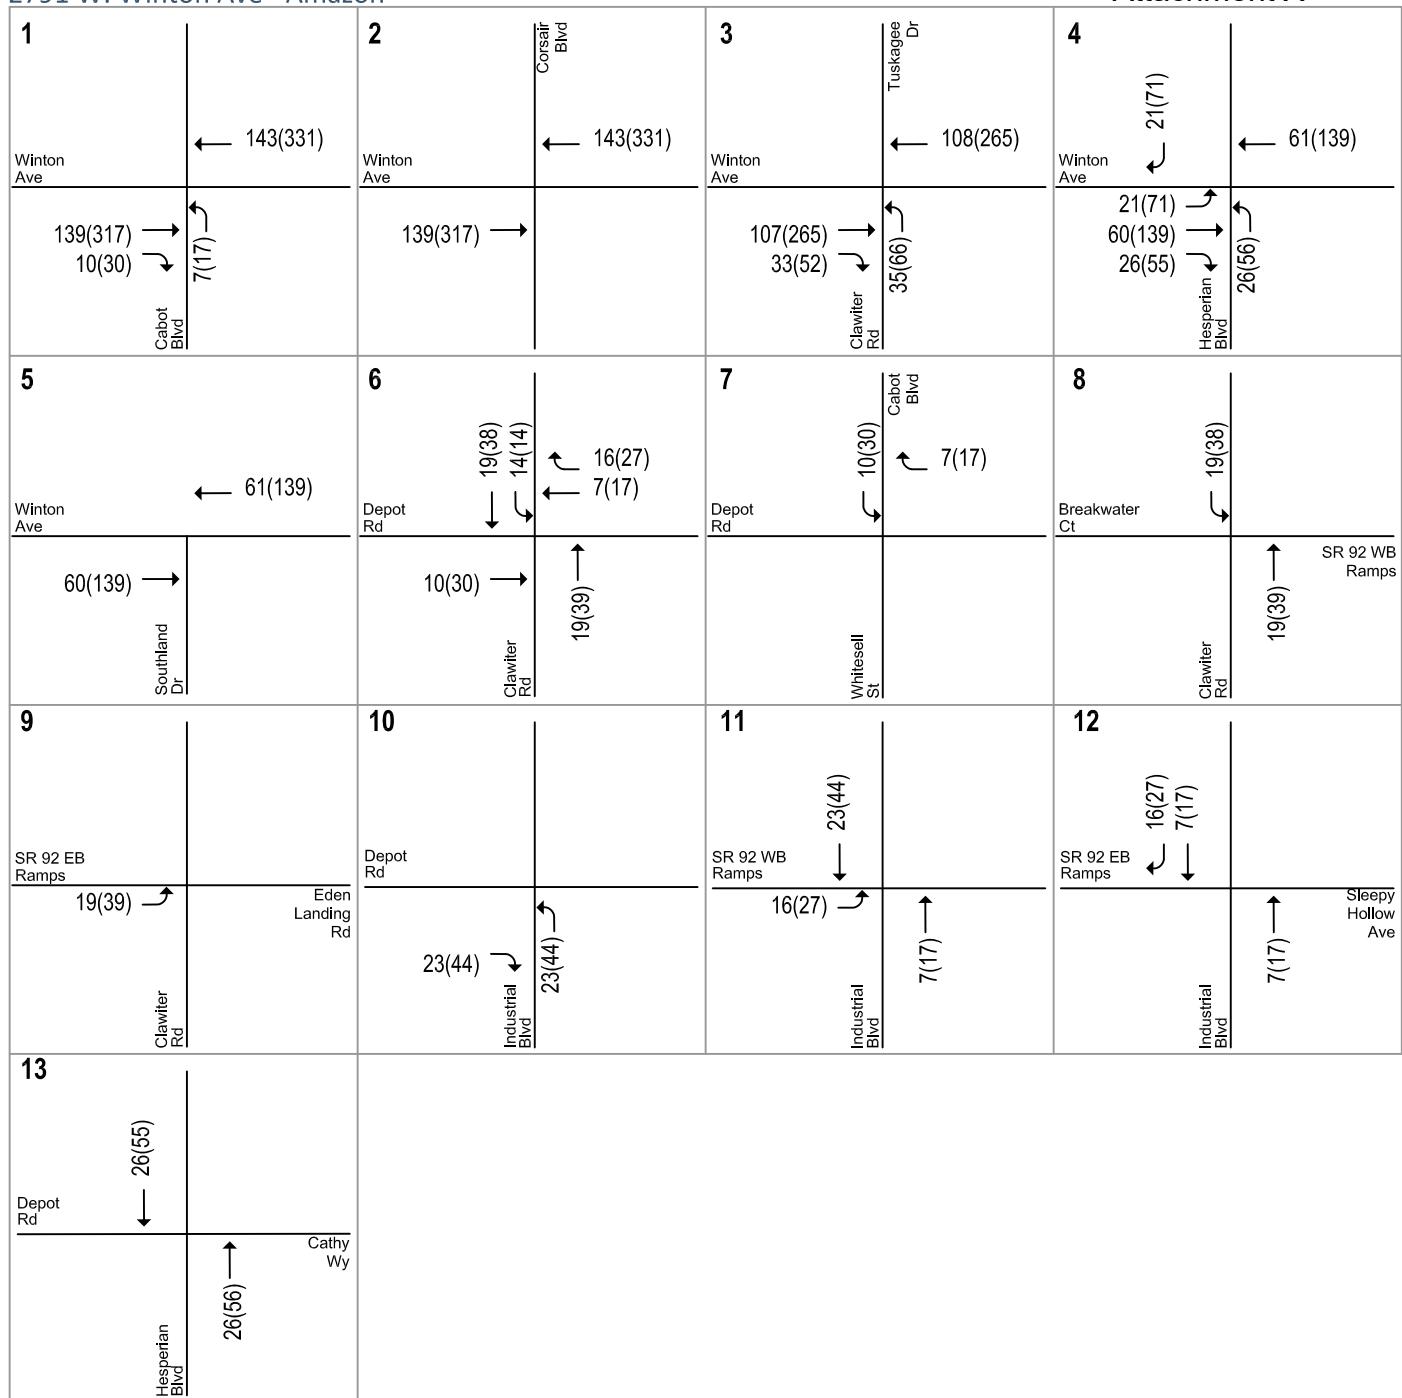

The trip distribution pattern for the project was estimated based on existing travel patterns on the surrounding roadway network and the locations of complementary land uses and under direction of the City of Hayward based on the City's General Plan Update Travel Demand Model. The trip distribution pattern for the project is shown on Figure 7. The peak-hour trips generated by the project were assigned to the roadway network in accordance with the project trip distribution pattern. Figure 8 shows the assignment of net project trips at each study intersection.

A tabular summary of project traffic at each study intersection is contained in Appendix B.

## 2791 W. Winton Ave - Amazon

**Figure 7**  
Project Trip Distribution

**LEGEND**

XX(XX) = AM(PM) Peak-Hour Trips

**Figure 8**  
**Project Trip Assignment**

## Existing Plus Project Traffic Volumes

Project trips, as represented in the above project trip assignment, were added to existing traffic volumes to obtain existing plus project traffic volumes (see Figure 9).

## Existing Plus Project Intersection Levels of Service

The results of the intersection level of service analysis under existing plus project conditions are summarized in Table 8. The results of the intersection level of service analysis show that the following study intersections would operate at unacceptable levels during the PM peak hours of traffic, and the project would have an adverse effect on operations:

- Cabot Boulevard and Winton Avenue
- Clawiter Road and SR 92 Eastbound Ramps/Eden Landing Road

Both intersections are unsignalized, and the level of service could be improved with the installation of traffic signals. The installation of traffic signals would restore both intersections to acceptable levels of service, LOS B. The signal warrant analysis is described below.

## Signal Warrant Analysis

The unsignalized study intersections of Cabot Boulevard/West Winton Avenue, Cabot Road/Depot Road, and Clawiter Road/SR 92 Eastbound Ramps/Eden Landing Road were analyzed for signalization, based on the Peak-Hour Volume Signal Warrant, (Warrant #3 – Part B) described in the *California Manual on Uniform Traffic Control Devices* (MUTCD), 2014 Edition. This method provides an indication whether peak-hour traffic volumes are, or would be, sufficient to justify installation of a traffic signal. Intersections that meet the peak hour warrant are subject to further analysis before determining that a traffic signal is necessary. Other options such as traffic control devices, signage, or geometric changes may be preferable based on existing field conditions.

The results of the peak-hour traffic signal warrants checks indicate that the Cabot Boulevard/Winton Avenue intersection would not meet the signal warrant under existing or existing plus project conditions. The intersection does not satisfy parts A and B of the traffic signal warrants analysis under either peak hours. However, the level of service at this intersection could be improved with the installation of a traffic signal. The installation of a traffic signal would restore the intersection to an acceptable level of service, LOS B.

The results of the peak-hour traffic signal warrants checks indicate that the Cabot Boulevard/Depot Road intersection would not meet the signal warrant under existing or existing plus project conditions.

The results of the peak-hour traffic signal warrant checks indicate that the Clawiter Road/SR 92 Eastbound Ramps/Eden Landing Road intersection would meet the signal warrant under existing or existing plus project conditions. The peak-hour signal warrant sheets are contained in Appendix D.

**Existing Plus Project Traffic Volumes**

## Existing Plus Project Roadway and Freeway Segment Levels of Service

The analysis methodology used to analyze roadway facilities is described in Chapter 1. The level of service was determined by comparing existing traffic volumes for selected roadway and freeway segments with hourly traffic capacities. Table 9 and 10 shows the results of the LOS analysis of MTS roadway segments and freeway segments for the 2020 analysis scenarios, with and without the proposed projects. 2020 volumes were obtained from the Alameda Transportation Commission's Countywide Travel Demand Model. As shown, all the study segments would operate at LOS E or better during both the AM and PM peak hours, under both 2020 baseline and 2020 plus project conditions.

## Freeway Ramp Capacity Analysis

This analysis consisted of a volume-to-capacity ratio evaluation of the eight freeway ramps at the interchange of I-880 and Winton Avenue for the Year 2020, to reflect existing conditions. The ramp capacities were obtained from the *Highway Capacity Manual 2000*, which considers both the free-flow speed and the number of lanes on the study ramps. The peak-hour freeway ramp volumes were obtained from the ACTC Model. Table 11 shows the 2020 AM and PM peak hour volumes and analysis of the freeway ramp capacity.

The ramp analysis showed that the freeway ramps currently have sufficient capacity to serve the existing traffic volumes. The study ramps have a volume-to-capacity (V/C) ratio that is well below 1.0, which means that the existing traffic demand is far lower than the ramp capacity.

**Table 11**  
**Existing Freeway Ramp Capacity Analysis**

Freeway Interchange and Ramp	Peak Hour	Existing Conditions						Project Conditions					
		Ramp Dir	Type	Meter	Lanes	Capacity <sup>1</sup> (vphpl)	Volume <sup>2</sup>	V/C Ratio	LOS	Add. Vol.	% Capacity	V/C Ratio	LOS

	PM	SB	L	-	1	1,800	99	0.06	A	0	0.0%	0.06	A

**Notes:**  
D = Diagonal ramp; L = Loop ramp

<sup>1</sup> Theoretical capacities of ramps per Exhibit 25-3 of HCM 2000: 2,000 vph for single-lane diagonal ramps, 1,800 vph for loop ramps, and 3,800 vph for dual-lane ramps. Capacity for metered on-ramps are calculated by multiplying the max metering rate (900 vphpl) by the number of lanes.

<sup>2</sup> Volumes derived from the latest available peak hour turning movement counts.

## Freeway Ramp Queuing Analysis

A vehicle queuing and storage analysis was conducted for high demand turn movements at the off-ramps where project traffic would be added. The intersection queuing analysis was conducted using SYNCHRO traffic analysis software. SYNCHRO provides 95<sup>th</sup>-percentile vehicle queues for each movement. The results of this analysis are summarized below in Table 12. The ramp analysis showed that the freeway ramps currently have sufficient capacity to serve the existing traffic queues.

**Table 12**  
**Existing Freeway Ramp Queuing Analysis**

Intersection	Movement	Peak Period	Storage Length (ft)	Existing		Existing Plus Project	
				95th Percentile Queue (feet) <sup>1</sup>	95th Percentile Queue (feet) <sup>1</sup>	Estimated Increase in 95th Percentile Queue (feet)	
SR 92 EB Off-Ramp to Clawiter Road	EBL	AM	225	150	175	25	
		PM	225	150	200	50	
SR 92 WB Off-Ramp to Industrial Road	EBL	AM	300	250	275	25	
		PM	300	150	175	25	

Notes:

EB = eastbound; WB = westbound.

LT = left turn movement.

<sup>1</sup> Based on 95th percentile queue reported by Synchro software using the HCM methodology.

<sup>2</sup> Queue lengths rounded up to nearest 25 feet.

<sup>3</sup> 25 feet per vehicle queued.

## 4. Background Conditions

---

This chapter presents background traffic conditions, which are defined as conditions just prior to completion of the proposed project. This chapter describes the procedure used to determine background traffic volumes and the resulting traffic conditions.

### Roadway Network Under Background Conditions

The roadway network under background conditions would be the same as the existing roadway network because there are no planned and funded transportation improvements at the study intersections that would alter the existing intersection lane configurations.

### Background Traffic Volumes

Background traffic volumes for the study intersections (see Figure 10) were estimated by applying a growth factor of 1% per year through the year 2025 (five years) to represent background traffic growth in the area. The growth factor was derived from the Hayward General Plan Update travel demand model.

Volumes under background conditions are presented in Appendix B.

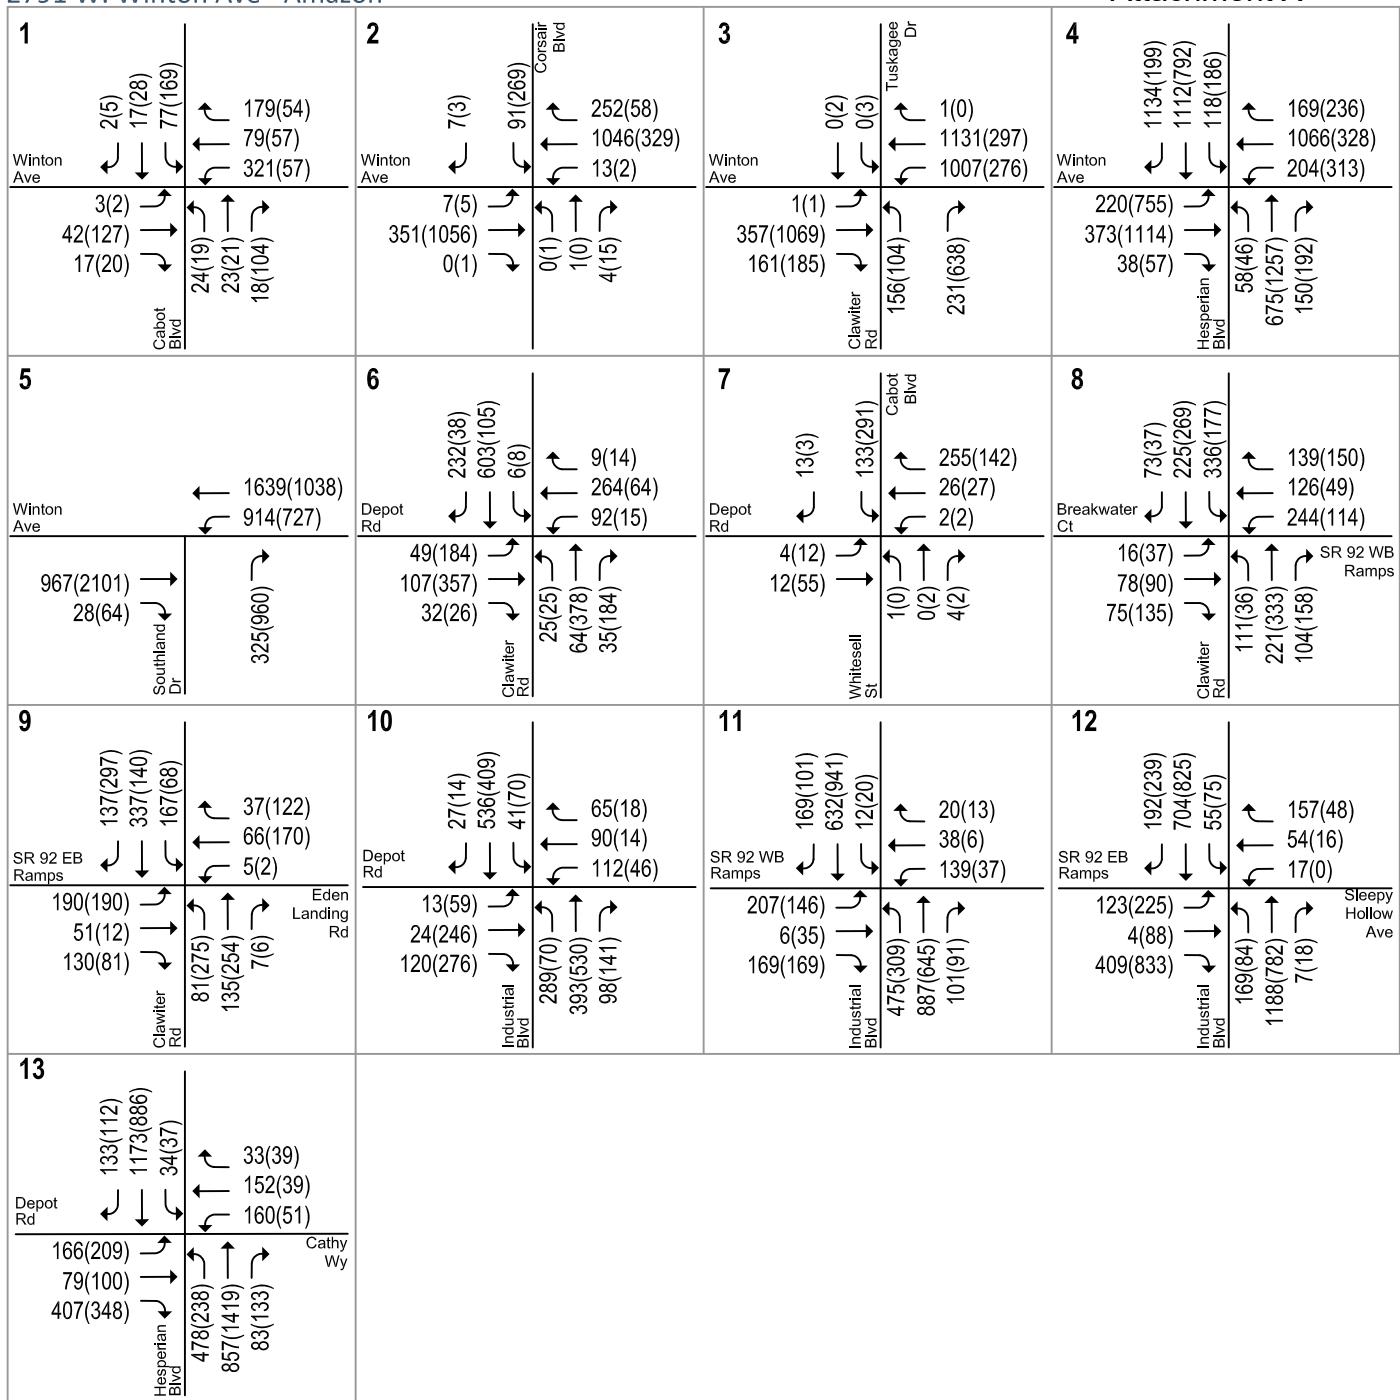

### Background Intersection Levels of Service

The results the level of service analysis under background conditions (see Table 13) show that the following study intersection would operate at an unacceptable level of service during the PM peak hour:

- Clawiter Road and SR 92 eastbound ramps/Eden Landing Road

All other study intersections would operate at acceptable level of service during both peak hours.

Intersection level of service calculation sheets are included in Appendix C.

**Notes:**  
 \* indicates the intersection level of service is calculated using the HCM 2000 module with the Synchro software. These intersections have unusual lane geometries that cannot be supported by Synchro HCM 2010 module.  
**BOLD** indicates a substandard level of service

## 5. Background Plus Project Conditions

---

This chapter describes background plus project traffic conditions. Background plus project conditions were evaluated relative to background conditions in order to determine potential project impacts.

### Roadway Network Under Background Plus Project Conditions

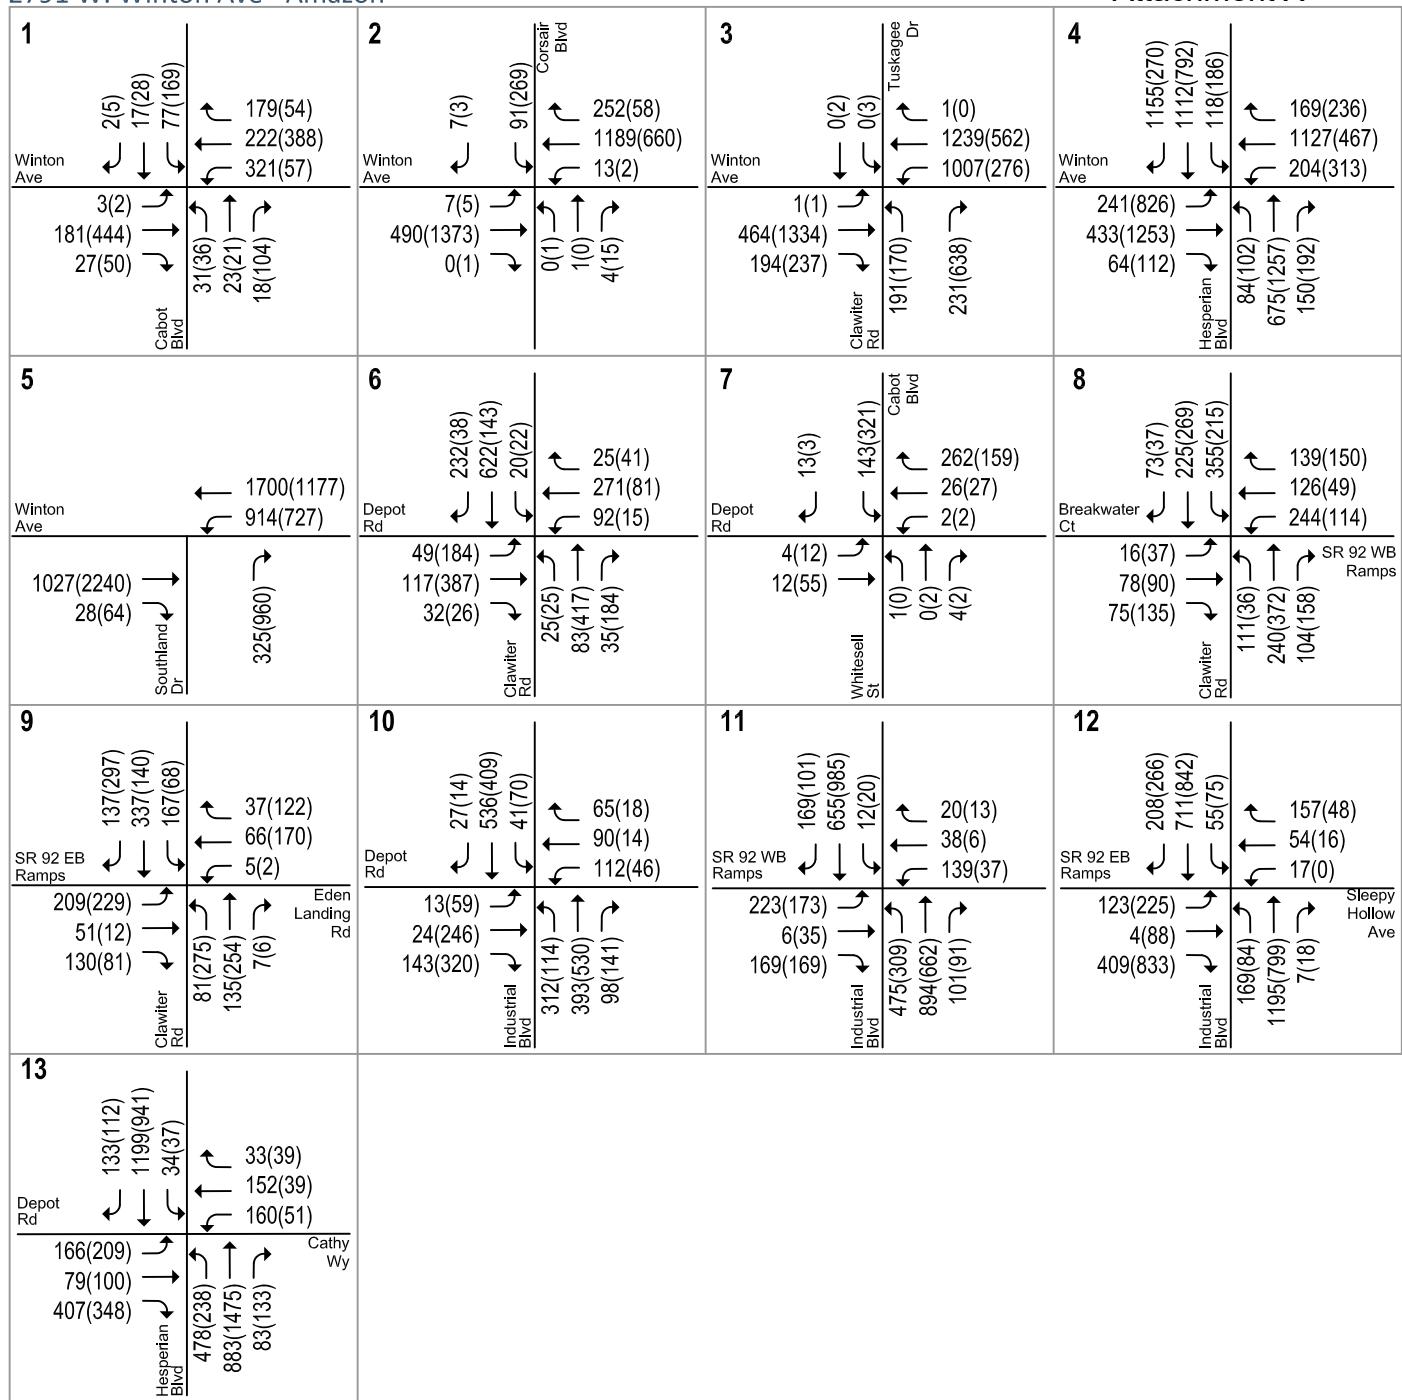

The roadway network under background plus project conditions would be the same as the existing plus project roadway network as described in Chapter 3.

### Project Trip Estimates

The estimated project trip generation, distribution and assignment are the same under background plus project conditions as previously described under existing plus project conditions (see Chapter 3).

### Background Plus Project Traffic Volumes

Project trips were added to background traffic volumes to obtain background plus project traffic volumes (see Figure 11).

**LEGEND**

XX(XX) = AM(PM) Peak-Hour Traffic Volumes

**Figure 11**  
**Background Plus Project Traffic Volumes**

## Background Plus Project Intersection Levels of Service

The results of the level of service analysis under background plus project conditions (see Table 14) show that the following study intersections would operate at an unacceptable level of service during the PM peak hour:

- Cabot Boulevard and West Winton Avenue
- Clawiter Road and SR 92 eastbound ramps/Eden Landing Road

The addition of project trips would cause the critical movement delay to increase by more than 5.0 seconds. Thus, the project would have an adverse effect at these intersections.

All other study intersections would operate at an acceptable level of service during both peak hours.

Intersection level of service calculation sheets are included in Appendix C.

The results of the peak-hour traffic signal warrant checks indicate that the Cabot Boulevard/Winton Avenue intersection would not meet the signal warrant under background or background plus project conditions. The intersection does not satisfy parts A and B of the traffic signal warrants analysis under either peak hour. However, the intersection level of service could be improved with the installation of a traffic signal. The installation of a traffic signal would restore the intersection to an acceptable level of service, LOS B.

The results of the peak-hour traffic signal warrant checks indicate that the Clawiter Road/SR 92 Eastbound Ramps/Eden Landing Road intersection would meet the signal warrant under background or background plus project conditions. The installation of a traffic signal would restore the intersection to an acceptable level of service, LOS C. The peak-hour signal warrant sheets are contained in Appendix D.

**Table 14**  
**Background Plus Project Intersection Levels of Service**

#	Intersection	Control	Peak Hour	Note	Background		Project		
					Avg. Delay (sec)	LOS	Avg. Delay (sec)	LOS	Incr. in Avg. Delay

**BOLD** indicates a substandard level of service

**boxed and BOLD** indicates adverse effect

## 6. Cumulative Conditions

---

This chapter describes the roadway traffic under cumulative and cumulative plus project conditions. Cumulative conditions represent future traffic conditions with expected growth in the area. The expected future growth conditions include approved projects in Hayward. This chapter describes the procedure used to determine cumulative conditions in order to determine potential project impacts.

### Roadway Network Under Cumulative Conditions

It is assumed in this analysis that the transportation network under cumulative conditions and cumulative plus project conditions would be the same as the background conditions and background plus project roadway network as described in Chapter 4.

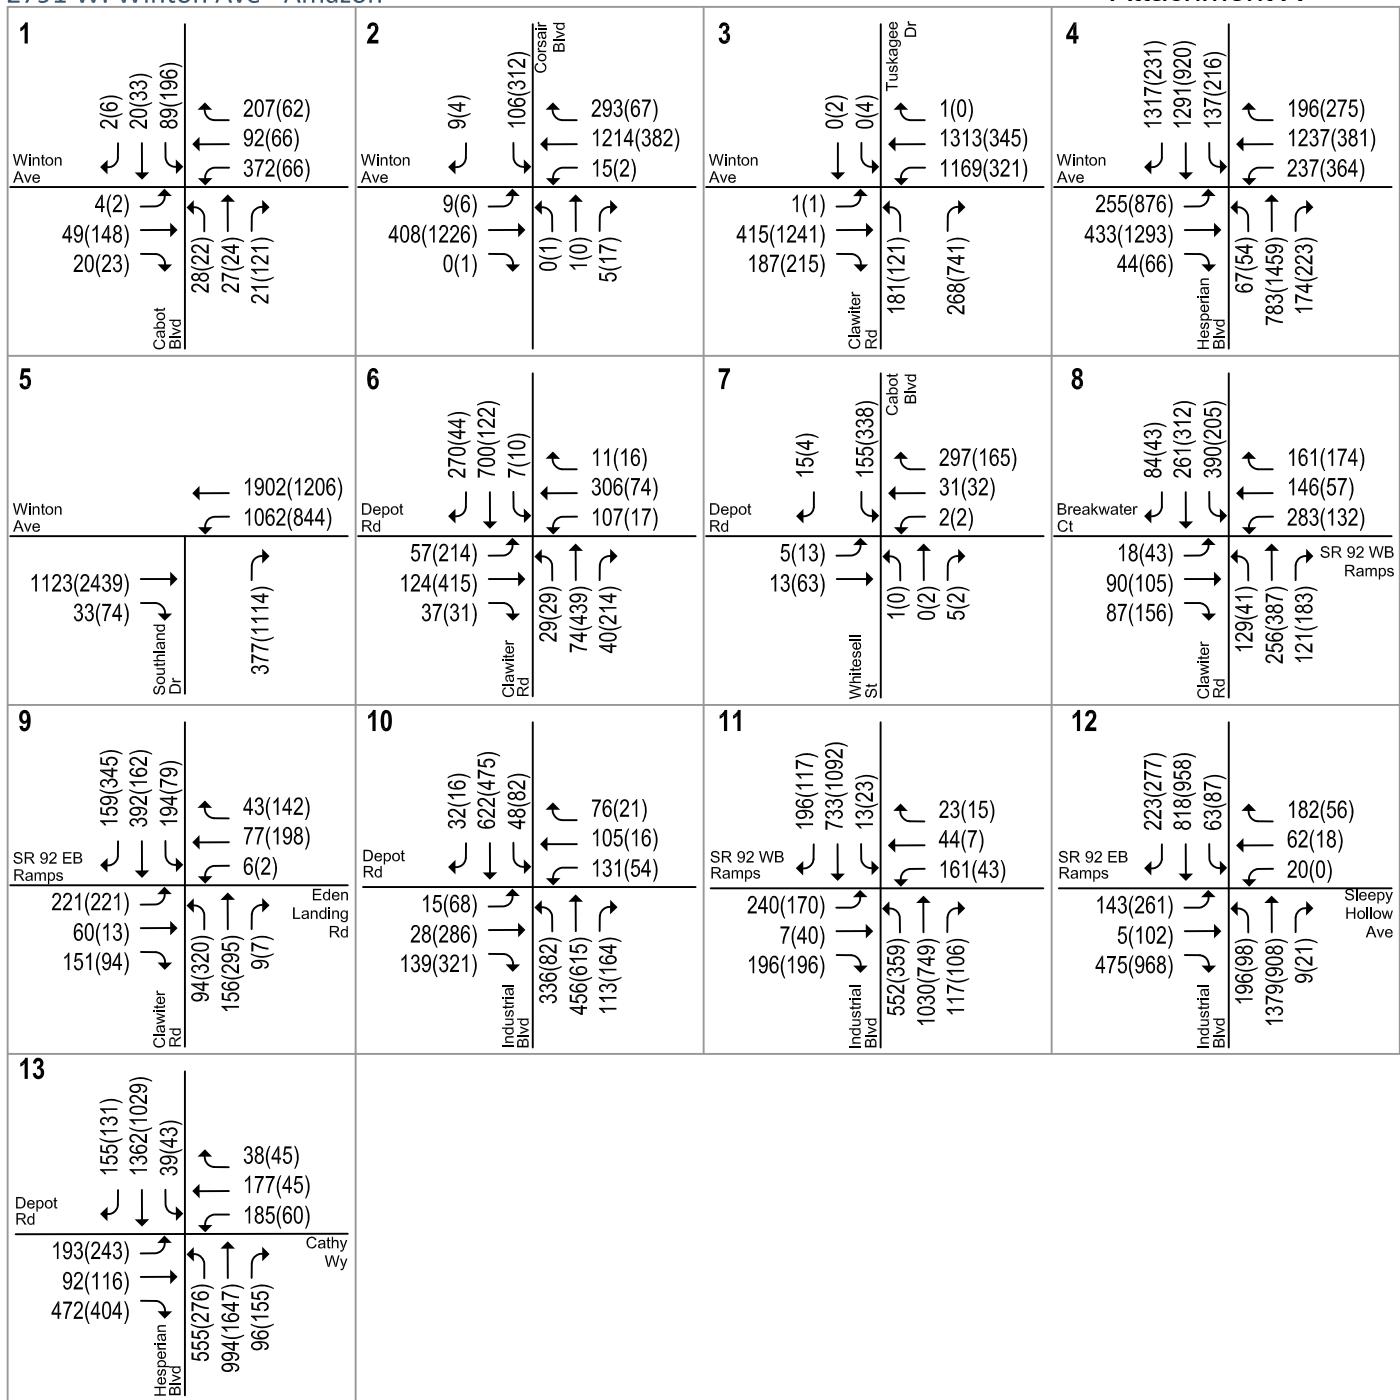

### Cumulative and Cumulative Plus Project Traffic Volumes

Cumulative traffic volumes for the study intersections (see Figure 12) were estimated by applying a growth factor of 1% per year through the year 2040 (20 years) to represent cumulative traffic growth in the area. The growth factor was derived from the Hayward General Plan Update travel demand model.

Project trips were added to cumulative traffic volumes to obtain cumulative plus project traffic volumes (see Figure 13).

**Figure 12**  
**Cumulative Traffic Volumes**

**LEGEND**

XX(XX) = AM(PM) Peak-Hour Traffic Volumes

**Figure 13**  
**Cumulative Plus Project Traffic Volumes**

## Cumulative Plus Project Intersection Levels of Service

The results of the level of service analysis under cumulative conditions (see Table 15) show that the following intersections would operate at an unacceptable level of service:

- Cabot Boulevard & West Winton Avenue - PM peak hour
- Clawiter Road & SR 92 eastbound ramps/Eden Landing Road – PM peak hour

The addition of project trips would cause the critical movement delay to increase by more than 5.0 seconds at both of these intersections.

The results of the level of service analysis under cumulative conditions also shows that the Hesperian Boulevard/Depot Road intersection would operate at an unacceptable level of service. However, the addition of project trips would not cause the critical movement delay to increase by more than 5.0 seconds. Therefore, the project would not have an adverse effect on the intersection.

All other study intersections would operate at an acceptable level of service during both peak hours. Intersection level of service calculation sheets are included in Appendix C.

The results of the peak-hour traffic signal warrant checks indicate that the Cabot Boulevard/West Winton Avenue intersection would not meet the signal warrant under cumulative or cumulative plus project conditions. However, the level of service at the intersection could be improved with the installation of traffic signal.

The results of the peak-hour traffic signal warrant checks indicate that the Clawiter Road/SR 92 Eastbound Ramps/Eden Landing Road intersection would meet the signal warrant under cumulative or cumulative plus project conditions. The peak-hour signal warrant sheets are contained in Appendix D.

**Table 15**  
**Cumulative Intersection Levels of Service**

#	Intersection	Control	Peak Hour	Note	Cumulative no Project		Cumulative plus Project		Cumulative plus Project w/ Improvements

## 7. Other Transportation Issues

---

This chapter presents other transportation issues associated with the project, including:

- Intersection vehicle queuing analysis
- Site access and circulation
- Pedestrians, bicycles, and transit facilities
- Parking

### Intersection Vehicle Queuing Analysis

A vehicle queuing and storage analysis was conducted for high demand turn movements at the selected study intersections where project traffic would be added. The intersection queuing analysis was conducted using SYNCHRO traffic analysis software. Along with providing overall control delay and level of service for the intersection, SYNCHRO provides total movement delay and 95<sup>th</sup>-percentile vehicle queues for each movement. The results of this analysis are summarized below and in Table 16 for the AM and PM peak hours.

**Table 16**  
**Queuing Analysis Summary**

Intersection	Movement	Peak Period	Storage Length (ft)	Existing		Existing Plus Project	
				95th Percentile Queue (feet) <sup>1</sup>	95th Percentile Queue (feet) <sup>1</sup>	Estimated Increase in 95th Percentile Queue (feet)	
Clawiter Road and Winton Avenue	NB LT	AM	100	125	150	25	
		PM	100	75	100	25	
	EB LT	AM	325	100	175	75	
		PM	325	75	150	75	
Hesperian Boulevard and Winton Avenue	NB LT	AM	350	150	175	25	
		PM	350	400	425	25	
	EB LT	AM	350	150	175	25	
		PM	350	400	425	25	
Industrial Boulevard and Depot Road	NB LT	AM	300	100	100	0	
		PM	300	75	100	25	

**Notes:**

EB = eastbound; NB = northbound.  
LT = left turn movement.

<sup>1</sup> Based on 95th percentile queue reported by Synchro software using the HCM methodology.

<sup>1</sup> Queue lengths rounded up to nearest 25 feet.

<sup>3</sup> 25 feet per vehicle queued.

Intersection	Movement	Peak Period	Storage Length (ft)	Background		Background Plus Project	
				95th Percentile Queue (feet) <sup>1</sup>	95th Percentile Queue (feet) <sup>1</sup>	Estimated Increase in 95th Percentile Queue (feet)	
Clawiter Road and Winton Avenue	NB LT	AM	100	125	125	0	
		PM	100	75	125	50	
Hesperian Boulevard and Winton Avenue	NB LT	AM	325	125	150	25	
		PM	325	75	175	100	
	EB LT	AM	350	150	150	0	
		PM	350	425	475	50	
Industrial Boulevard and Depot Road	NB LT	AM	300	125	275	150	
		PM	300	75	100	25	

Notes:

EB = eastbound; NB = northbound.

LT = left turn movement.

<sup>1</sup> Based on 95th percentile queue reported by Synchro software using the HCM methodology.

<sup>1</sup> Queue lengths rounded up to nearest 25 feet.

<sup>3</sup> 25 feet per vehicle queued.

Intersection	Movement	Peak Period	Storage Length (ft)	Cumulative		Cumulative Plus Project	
				95th Percentile Queue (feet) <sup>1</sup>	95th Percentile Queue (feet) <sup>1</sup>	95th Percentile Queue (feet) <sup>1</sup>	Estimated Increase in 95th Percentile Queue (feet)
Clawiter Road and Winton Avenue	NB LT	AM	100	125	175	50	
		PM	100	100	150	50	
Hesperian Boulevard and Winton Avenue	NB LT	AM	325	150	200	50	
		PM	325	100	225	125	
	EB LT	AM	350	200	225	25	
		PM	350	575	700	125	
Industrial Boulevard and Depot Road	NB LT	AM	300	125	350	225	
		PM	300	100	125	25	

Notes:

EB = eastbound; NB = northbound.

LT = left turn movement.

<sup>1</sup> Based on 95th percentile queue reported by Synchro software using the HCM methodology.

<sup>1</sup> Queue lengths rounded up to nearest 25 feet.

<sup>3</sup> 25 feet per vehicle queued.

## Clawiter Road and Winton Avenue

The project would add trips to the northbound left-turn at the intersection of Clawiter Road and Winton Avenue. The analysis indicates that the 95<sup>th</sup> percentile vehicle queues would not be accommodated by the existing storage space for the northbound left-turn movement during the AM peak hour and would continue to do so under all scenarios. With the addition of the project traffic, the estimated increase in the 95<sup>th</sup> percentile queue for the northbound left-turn movement would be 1 and 2 vehicles for the existing plus project and cumulative plus project scenarios, respectively. The left turn pocket could be

extended by 50 feet into the existing two-way left turn lane to accommodate both the existing and project left turn volumes.

### Hesperian Boulevard and Winton Avenue

The project would add trips to the northbound left-turn and the eastbound left-turn at the intersection of Hesperian Boulevard and Winton Avenue. The analysis indicates that the 95<sup>th</sup> percentile vehicle queues would not be accommodated by the existing storage space for the eastbound left-turn movement during the PM peak hour and would continue to do so under all scenarios. With the addition of the project traffic, the estimated increase in the 95<sup>th</sup> percentile queue for the eastbound left-turn movement would be 1, 2 and 5 vehicles for the existing plus project, background plus project and cumulative plus project scenarios, respectively. There is no room in the median on Winton Avenue to lengthen the left turn pocket. The analysis indicates that the 95<sup>th</sup> percentile vehicle queue would be accommodated by the existing storage space for the northbound left-turn movement during both peak hours and would continue to do so under all scenarios.

### Industrial Boulevard and Depot Road

The project would add trips to the northbound left-turn at the intersection of Industrial Boulevard Depot Road. The analysis indicates that the 95<sup>th</sup> percentile vehicle queues are accommodated by the existing storage space for the northbound left-turn movement during both peak hours. With the addition of project traffic, the estimated 95<sup>th</sup> percentile queue for the northbound left-turn movement would exceed the storage length by 2 vehicles in the cumulative plus project scenario. There is room in the median on Industrial Boulevard to lengthen the left turn pocket. However, the landscaped median would need to be modified or removed.

## Site Access and Circulation

A review of site access and circulation was completed based on the site plan dated April 20, 2020 and shown in Figure 2.

### Vehicle Site Access and Circulation

Vehicle access to the project site would continue to be provided via three site driveways on West Winton Avenue. The left and middle driveways on West Winton Avenue would serve the van driver vehicles, and the right driveway on West Winton Avenue would serve customer vehicles, employee and manager vehicles, and line haul trucks. As shown in Table 4, there would be 150 inbound and 149 outbound trips accessing the driveways during the AM peak hour and 348 inbound and 347 outbound trips during the PM peak hour.

According to the City of Hayward Municipal Code, the minimum driveway width is 12 feet, except where a driveway would be along arterial or major collector streets it is 16 feet. According to the site plan, all driveways would be approximately 26 feet, which meets the City Standard.

On-site circulation was reviewed in accordance with generally accepted traffic engineering standards. The project site would have three-full access driveways along Winton Avenue that lead to a parking lot. In the parking lot, there would be two-way drive aisles with 90-degree perpendicular parking spaces. The drive aisles would be at least 24 feet wide and would provide sufficient space for vehicles to back out of the parking stalls. Generally, the proposed plan would provide sufficient space for vehicle traffic with adequate connectivity through the parking areas. The drive aisle would be at least 30 feet and would provide sufficient spaces for vans to enter and exit the distribution facility. It is expected that operations would not create spillback onto West Winton Avenue given the adequate space provided within the project site.

## Sight Distance Analysis

Sight distance was evaluated to determine if a driver will have adequate visibility to enter W. Winton Avenue from the driveways. The project access points should be free and clear of any obstructions that would materially and adversely affect sight distance, thereby ensuring that exiting vehicles can see pedestrians on the sidewalk and other vehicles traveling on adjacent roadways. Landscaping and parking should not conflict with a driver's ability to locate a gap in traffic and see oncoming pedestrians and bicyclists. Adequate corner sight distance (sight distance triangles) should be provided at all site access points in accordance with the City's standards. Sight distance requirements vary depending on the roadway speeds. The speed limit on West Winton Avenue is 35 mph. According to the Highway Design Manual (HDM), Chapter 200, 2014, the required minimum stopping sight distance for design speed of 35 mph is 250 feet. The line of sight for vehicles exiting the driveways and vehicles travelling eastbound and westbound on West Winton Avenue are clear and visible. Vehicles exiting the driveways will be visible to the vehicles travelling eastbound and westbound on West Winton Avenue. One recommendation would be that on-street truck and auto parking be prohibited for 50 feet on either side of the driveways to preserve sight distance. The project would not substantially increase hazards due to any design features.

## Transit, Pedestrian and Bicycle Analysis

A significant impact occurs if the proposed project conflicts with applicable or adopted policies, plans or programs related to pedestrian facilities or otherwise decrease the performance or safety of pedestrian facilities. The proposed project would not result in any significant impacts to existing or planned pedestrian facilities in the immediate vicinity of the project because of the absence of such conflicts; therefore, the impact to pedestrian facilities is less-than-significant.

In terms of bicycle access to the project site, West Winton Avenue and Cabot Boulevard are classified as Class III Bike routes per the City of Hayward Bicycle Master Plan. Overall, the existing bicycle facilities provide adequate connectivity between the proposed project site and the adjacent neighborhoods. An impact to bicyclists occurs if the proposed project disrupts existing bicycle facilities; or conflicts with or creates inconsistencies with adopted bicycle system plans, guidelines, and policies. A significant impact occurs if the proposed project conflicts with applicable or adopted policies, plans or programs related to bicycle facilities or otherwise decrease the performance or safety of bicycle facilities. The proposed project would not conflict with existing and planned bicycle facilities; therefore, the impact to bicycle facilities is less-than-significant.

The 2020 Hayward Bicycle and Pedestrian Master Plan Update identifies the section along West Winton Avenue between Cabot Boulevard and the Bay Trail as a proposed Class III Bicycle Boulevard. The Project applicant should work with the City to implement the Class III Bicycle Boulevard as part of the project and to be consistent with City's Bicycle and Pedestrian Master Plan. Upgrading this section of roadway to include a Class III Bicycle Boulevard would enhance the bicycle-user experience and therefore encourage non-auto travel.

The entrance to the Bay Trail, a bike and pedestrian path, is located west of the project site along West Winton Avenue. The Bay Trail runs along the east boundary of the San Francisco Bay. There are sidewalks leading up to the west end of the project site. However, there are no existing sidewalks leading to the Bay Trail. Currently, there is low traffic volume in this area of West Winton Avenue. However, more development could increase the amount of traffic in this area. The project should contribute to future construction of sidewalks that provide pedestrian access to the Bay Trail.

The proposed project would generate very few trips via transit services, which can be accommodated by the existing transit capacity, and, hence, the project is anticipated to have a less-than-significant impact on transit facilities.

### **Emergency Vehicle Access**

The site plan shows adequate driveway width for emergency vehicles to access through the site. There is sufficient space to turn around at the end of the dead-end aisles via turnaround spaces.

## **Parking**

Parking provided on the site was evaluated based on the parking requirements set forth by the City of Hayward. According to the City of Hayward Municipal Code, warehouse uses requires one space for each 2,000 square feet of gross floor area. Based on the City of Hayward Municipal Code, the project is required to provide 253 parking spaces. The project proposes to provide 1,143 parking spaces, which meets the City requirements.

## 8. Conclusions

---

The potential impacts of the project were evaluated in accordance with the standards set forth by the City of Hayward. The study analyzes the traffic impacts of the proposed development on the key intersections during the weekday AM and PM peak hours of traffic. In addition, the study includes a vehicle queuing analysis at selected intersections, a review of site access and circulation, an evaluation of potential impacts to transit services and pedestrian and bicycle facilities, and an evaluation of parking.

### Project Trip Estimates

The project is estimated to generate 4,151 daily vehicle trips, with 299 trips occurring during the AM peak hour and 695 trips during the PM peak hour.

### Local Transportation Assessment (LTA)

The results of the Local Transportation Analysis (LTA) show that the following study intersections would operate at an unacceptable conditions during the PM peak hour under all scenarios:

- Cabot Boulevard and West Winton Avenue
- Clawiter Road and SR 92 eastbound ramps/Eden Landing Road

The addition of project trips would cause the critical movement delay to increase by more than 5.0 seconds at these intersections. Thus, the project would have an adverse effect on operations at these intersections.

### Recommended Improvements

The results of the peak-hour traffic signal warrants checks indicate that the Cabot Road/Winton Avenue intersection would not meet the signal warrant. The intersection does not satisfy parts A and B of the traffic signal warrants analysis under either peak hour. However, level of service at this intersection would be improved to satisfactory levels with the installation of a traffic signal under all conditions.

The results of the peak-hour traffic signal warrant checks indicate that the Clawiter Road/SR 92 Eastbound Ramps/Eden Landing Road intersection would meet the signal warrant under all conditions.

The installation of traffic signals at the Cabot Boulevard/West Winton Avenue and Clawiter Road and SR 92 eastbound ramps/Eden Landing Road intersections would improve the level of service at these intersections to satisfactory levels. According to the City of Hayward Traffic Study Interim Guidelines, when a project results in an impact or signal warrants being met at a study intersection, the project must make a fair share contribution to the cost of improvements. Based on the impacts or traffic signal warrants being met, the project contribution would be 100% at these intersections.

The extension of the northbound left-turn pocket at the intersection of Clawiter Road/Winton Avenue by 50 feet into the existing two-way left-turn lane would accommodate both the existing and project left turn volumes. This can be accomplished by re-striping the existing two-way left turn lane.

## Transit, Pedestrian and Bicycle Analysis

The proposed project does not conflict with existing or planned pedestrian and bicycle facilities. The transit service within the immediate vicinity of the project site operates well below capacity, and additional trips generated by the proposed project could be accommodated by existing bus services. Therefore, the impacts to pedestrian, bicycle and transit facilities would be less-than significant. The project should re-stripe West Winton Avenue between Cabot Boulevard and the Bay Trail entrance to include a Class III Bicycle Boulevard, which is an improvement consistent with the City's Bicycle and Pedestrian Master Plan.

There are no existing sidewalks leading to the Bay Trail. Currently, there is low traffic volume in this area of West Winton Avenue. However, more development could increase the amount of traffic in this area. The project should contribute to future construction of sidewalks that provide pedestrian access to the Bay Trail.

## Freeway Segment Analysis

The freeway study segments operate at LOS E or better during the AM and PM commute peak hours under existing conditions. The proposed project would not result in any potentially significant impact to any of the freeway study segments under 2020 plus project conditions.

## Freeway Ramp Capacity Analysis

At the I-880 and Winton Avenue interchange under Existing and Existing Plus Project, all ramps have a volume to capacity (V/C) ratio that is below 1.0, which means that the existing traffic demand is lower than the ramp capacity.

## Freeway Ramp Queuing Analysis

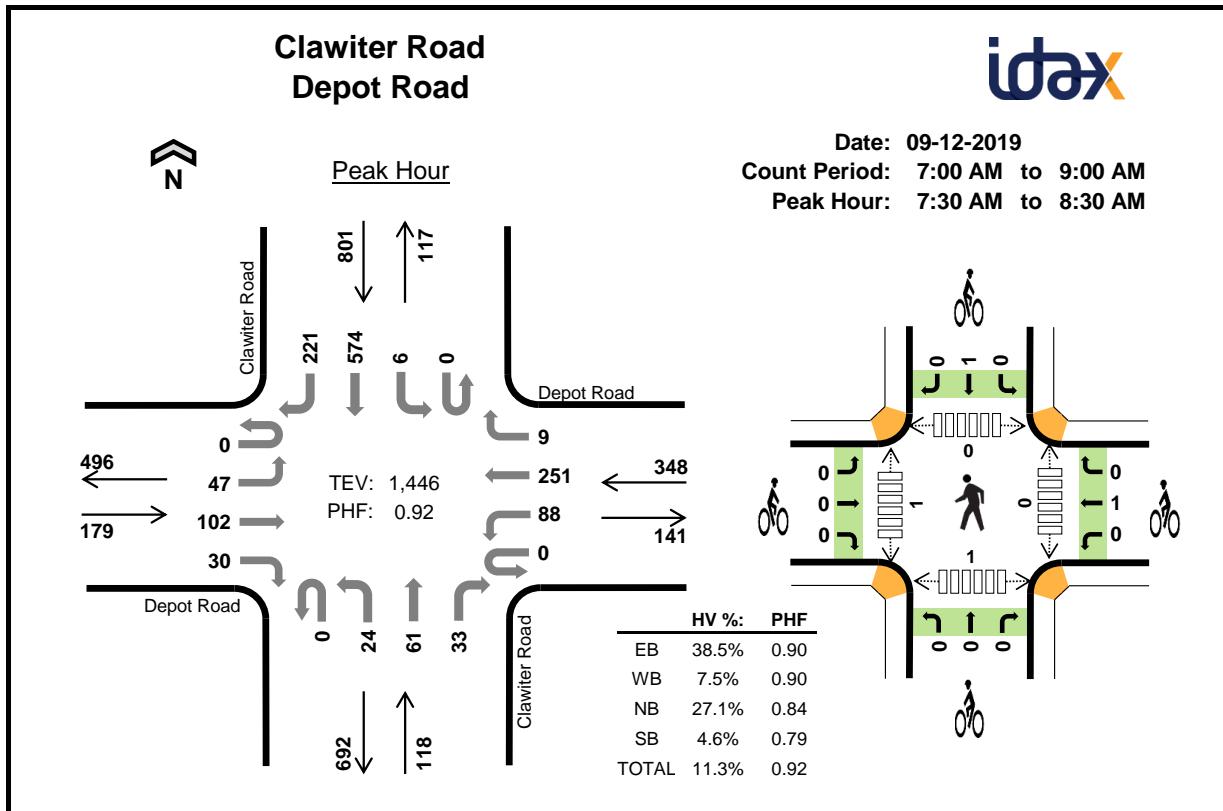

At the Clawiter Road/SR 92 Eastbound Ramps and Industrial Boulevard/SR 92 Westbound Ramps intersections, both freeway off-ramps have sufficient capacity to serve the existing traffic queues.

## TRAFFIC SIGNAL WARRANTS WORKSHEET

Major Street: Depot Road  
 Minor Street: Cabot Boulevard

Analyst: JW date: 7/2/20  
 Critical Approach Speed\* (mph) 35  
 Critical Approach Speed\* (mph) 35  
 \*Posted Speed.

Critical speed of major street traffic &gt; 50 mph (64 km/h).....

In built up area of isolated community of &lt; 10,000 population.....

 Urban (U)

or  
Rural (R)

## AM PEAK PERIOD

## Warrant 3 - Peak Hour

The need for a traffic control signal should be considered if an engineering study finds that the criteria in either of the following two categories (Parts A and B) are met:

**PART A**

(All parts 1, 2, and 3 below must be satisfied)

	AM PEAK PERIOD						
	Existing	Existing + Proj	Background	Background + Proj	Cumulative	Cumulative + Proj	
Minor Street Approach Direction w/ Highest Delay	SB	SB	SB	SB	SB	SB	
Highest Minor Street Average Delay (sec/veh)	10.0	10.3	10.2	10.4	10.9	11.2	
Corresponding Minor Street Approach Volume (veh/hr)	139	149	146	156	170	180	
Minor Street Total Delay (veh-hrs)	0.4	0.4	0.4	0.5	0.5	0.6	
Total Entering Volume (veh/hr)	429	446	450	467	524	541	
1. The total delay experienced for traffic on one minor street approach controlled by a STOP sign equals or exceeds 4 vehicle-hours for a 1-lane approach and 5 vehicle-hours for a 2-lane approach; <u>AND</u>	No	No	No	No	No	No	
2. The volume on the same minor street approach equals or exceeds 100 vph for 1 moving lane of traffic or 150 vph for 2 moving lanes; <u>AND</u>	No	No	No	Yes	Yes	Yes	
3. The total entering volume serviced during the hour equals or exceeds 800 vph for intersections with 4 or more approaches or 650 vph for intersections with 3 approaches.	No	No	No	No	No	No	
<b>Signal Warranted based on Part A?</b>	No	No	No	No	No	No	

**PART B**

	Approach Lanes	AM PEAK PERIOD						
		Existing	Existing + Proj	Background	Background + Proj	Cumulative	Cumulative + Proj	
Major Street - Both Approaches	Depot Road	X		285	292	299	306	348 355
Minor Street - Highest Approach	Cabot Boulevard		X	139	149	146	156	170 180
<b>Signal Warranted based on Part B?</b>		No	No	No	No	No	No	

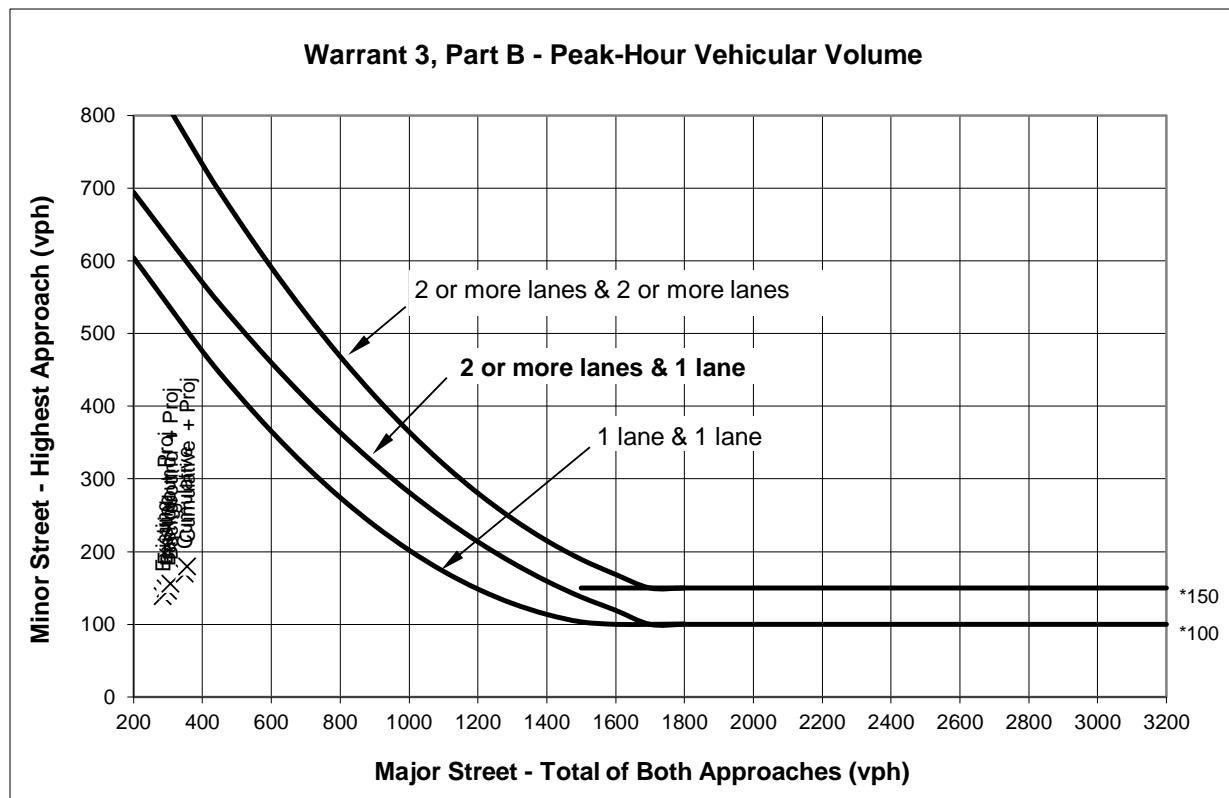

The Warrant is satisfied if the plotted point for vehicles per hour on the major street (both approaches) and the corresponding per hour higher vehicle volume minor street approach (one direction only) for one hour (any four consecutive 15-minute periods) fall above the applicable curves in California MUTCD Figure 4C-3 or 4C-4.

## PM PEAK HOUR

**Warrant 3 - Peak Hour**

The need for a traffic control signal should be considered if an engineering study finds that the criteria in either of the following two categories (Parts A and B) are met:

**PART A**

(All parts 1, 2, and 3 below must be satisfied)

PM PEAK HOUR							
	Existing	Existing + Proj	Background	Background + Proj	Cumulative	Cumulative + Proj	
Minor Street Approach Direction w/ Highest Delay	SB	SB	SB	SB	SB	SB	
Highest Minor Street Average Delay (sec/veh)	13.8	15.3	14.5	16.2	18.0	20.9	
Corresponding Minor Street Approach Volume (veh/hr)	280	310	294	324	342	372	
Minor Street Total Delay (veh-hrs)	1.1	1.3	1.2	1.5	1.7	2.2	
Total Entering Volume (veh/hr)	510	557	536	583	621	668	
1. The total delay experienced for traffic on one minor street approach controlled by a STOP sign equals or exceeds 4 vehicle-hours for a 1-lane approach and 5 vehicle-hours for a 2-lane approach; <u>AND</u>	No	No	No	No	No	No	
2. The volume on the same minor street approach equals or exceeds 100 vph for 1 moving lane of traffic or 150 vph for 2 moving lanes; <u>AND</u>	Yes	Yes	Yes	Yes	Yes	Yes	
3. The total entering volume serviced during the hour equals or exceeds 800 vph for intersections with 4 or more approaches or 650 vph for intersections with 3 approaches.	No	No	No	No	No	No	
<b>Signal Warranted based on Part A?</b>	No	No	No	No	No	No	

**PART B**

PM PEAK HOUR							
	Approach Lanes	Existing	Existing + Proj	Background	Background + Proj	Cumulative	Cumulative + Proj
Major Street - Both Approaches	Depot Road	X		226	243	238	255
Minor Street - Highest Approach	Cabot Boulevard		X	280	310	294	324
<b>Signal Warranted based on Part B?</b>		No	No	No	No	No	No

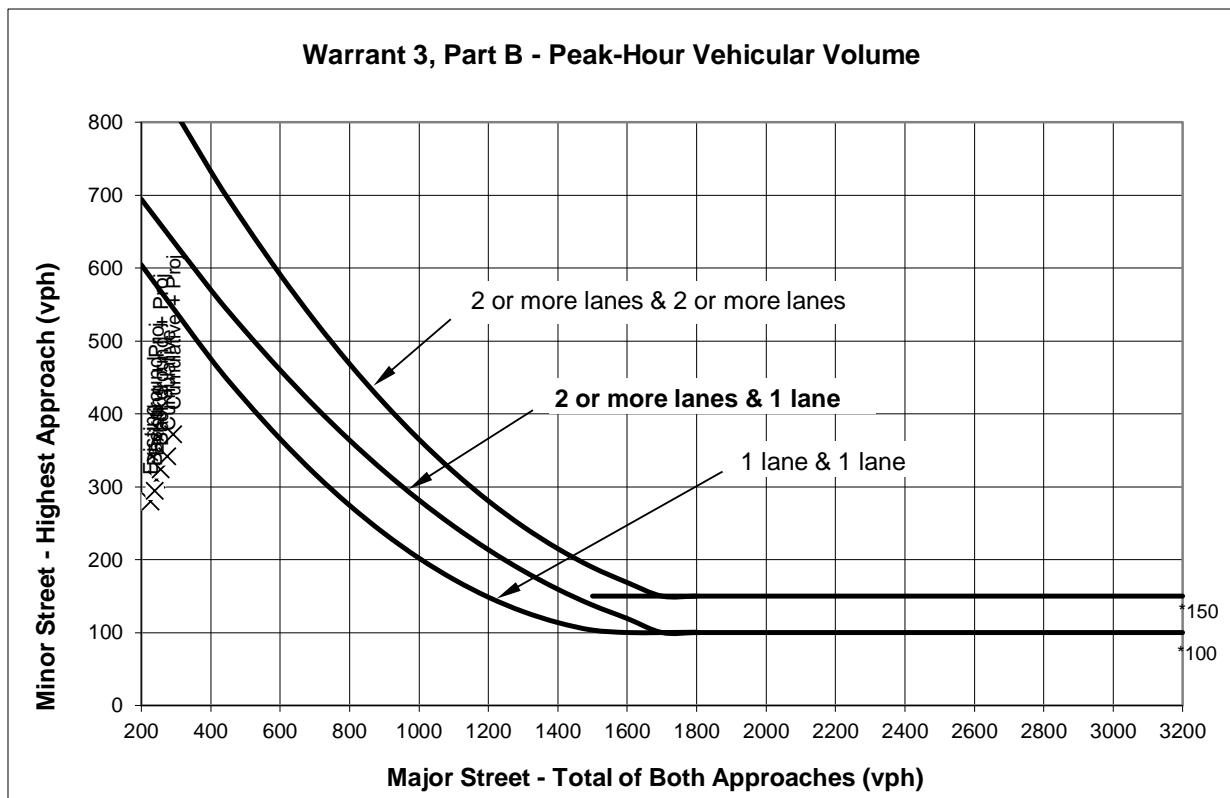

The Warrant is satisfied if the plotted point for vehicles per hour on the major street (both approaches) and the corresponding per hour higher vehicle volume minor street approach (one direction only) for one hour (any four consecutive 15-minute periods) fall above the applicable curves in California MUTCD Figure 4C-3 or 4C-4.

Minor Street Total Delay (veh-hrs)	2.4	2.5	2.8	3.5	6.8	8.5	
Total Entering Volume (veh/hr)	1279	1298	1343	1362	1562	1581	

1. The total delay experienced for traffic on one minor street approach controlled by a STOP sign equals or exceeds 4 vehicle-hours for a 1-lane approach and 5 vehicle-hours for a 2-lane approach; AND
  2. The volume on the same minor street approach equals or exceeds 100 vph for 1 moving lane of traffic or 150 vph for 2 moving lanes; AND
  3. The total entering volume serviced during the hour equals or exceeds 800 vph for intersections with 4 or more approaches or 650 vph for intersections with 3 approaches.

### **Signal Warranted based on Part A?**

---

**PART B**

---

	Approach Lanes	AM PEAK PERIOD							
		2 or One	More	Existing	Existing + Proj	Background	Background + Proj	Cumulative	Cumulative + Proj
Major Street - Both Approaches	Clawiter Road		X	822	822	864	864	1004	1004
Minor Street - Highest Approach	Eden Landing Road/ SR 92 Eastbound Ramps	X		354	373	371	390	432	451
<b>Signal Warranted based on Part B?</b>				Yes	Yes	Yes	Yes	Yes	Yes

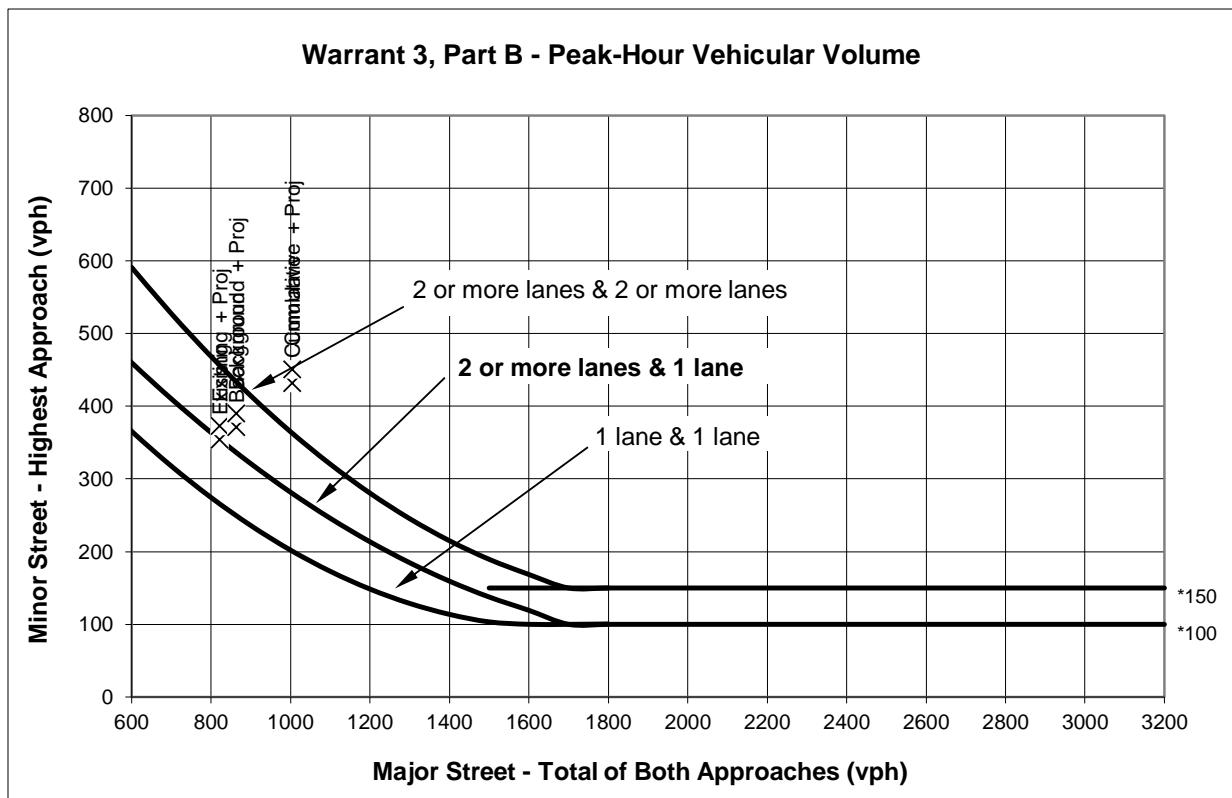

The Warrant is satisfied if the plotted point for vehicles per hour on the major street (both approaches) and the corresponding per hour higher vehicle volume minor street approach (one direction only) for one hour (any four consecutive 15-minute periods) fall above the applicable curves in California MUTCD Figure 4C-3 or 4C-4.

 Critical Approach Speed\* (mph) 25  
 \*Posted Speed.

Critical speed of major street traffic &gt; 50 mph (64 km/h).....

In built up area of isolated community of &lt; 10,000 population.....

 Urban (U)

## PM PEAK HOUR

## Warrant 3 - Peak Hour

The need for a traffic control signal should be considered if an engineering study finds that the criteria in either of the following two categories (Parts A and B) are met:

**PART A**

(All parts 1, 2, and 3 below must be satisfied)

PM PEAK HOUR						
	Existing	Existing + Proj	Background	Background + Proj	Cumulative	Cumulative + Proj
Minor Street Approach Direction w/ Highest Delay	WB	WB	WB	WB	WB	WB
Highest Minor Street Average Delay (sec/veh)	56.8	64.0	72.9	82.4	148.4	156.2
Corresponding Minor Street Approach Volume (veh/hr)	280	280	294	294	342	342
Minor Street Total Delay (veh-hrs)	4.4	5.0	6.0	6.7	14.1	14.8
Total Entering Volume (veh/hr)	1540	1579	1617	1656	1878	1917
1. The total delay experienced for traffic on one minor street approach controlled by a STOP sign equals or exceeds 4 vehicle-hours for a 1-lane approach and 5 vehicle-hours for a 2-lane approach; <u>AND</u>	Yes	Yes	Yes	Yes	Yes	Yes
2. The volume on the same minor street approach equals or exceeds 100 vph for 1 moving lane of traffic or 150 vph for 2 moving lanes; <u>AND</u>	Yes	Yes	Yes	Yes	Yes	Yes
3. The total entering volume serviced during the hour equals or exceeds 800 vph for intersections with 4 or more approaches or 650 vph for intersections with 3 approaches.	Yes	Yes	Yes	Yes	Yes	Yes
<b>Signal Warranted based on Part A?</b>	Yes	Yes	Yes	Yes	Yes	Yes

**PART B**

			PM PEAK HOUR							
			Approach Lanes		Existing	Existing + Proj	Background	Background + Proj	Cumulative	Cumulative + Proj
			2 or One More							
Major Street - Both Approaches	Clawiter Road		X		991	991	1040	1040	1208	1208
Minor Street - Highest Approach	Eden Landing Road/ SR 92 Eastbound Ramps	X			280	308	294	322	342	367
<b>Signal Warranted based on Part B?</b>			Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes

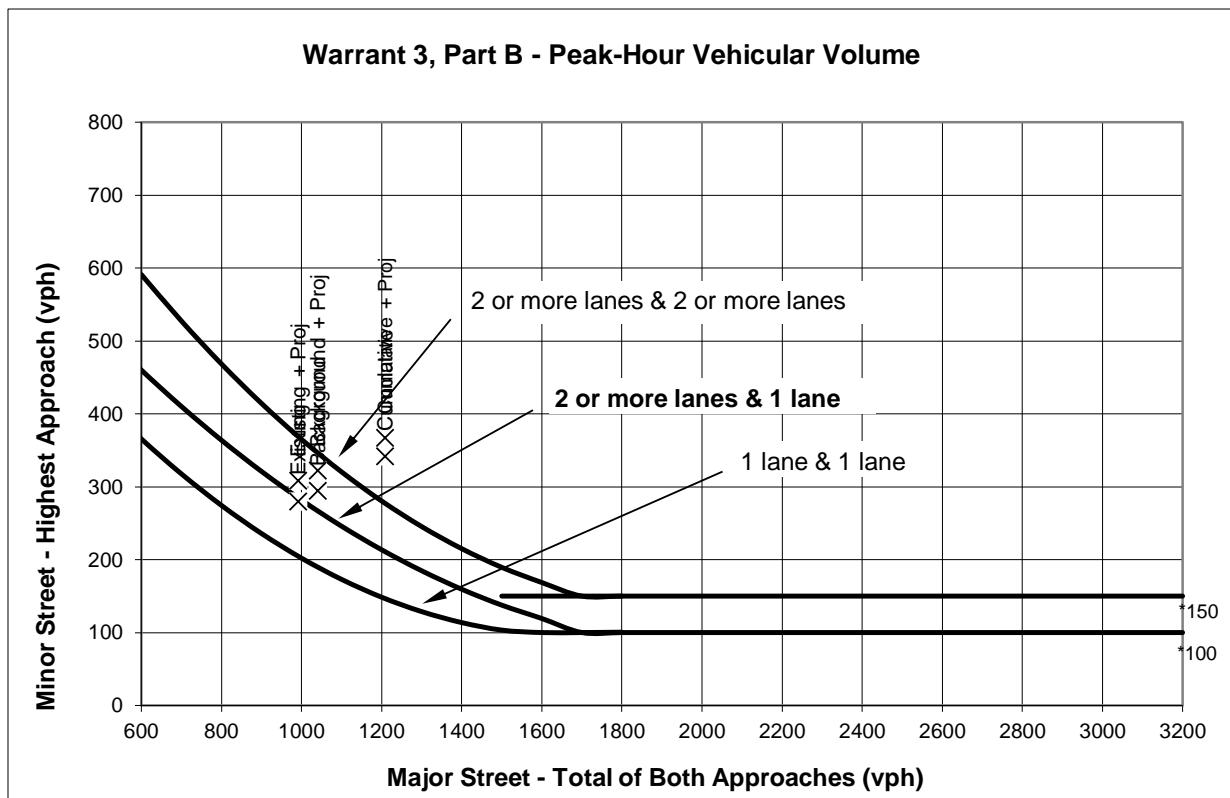

The Warrant is satisfied if the plotted point for vehicles per hour on the major street (both approaches) and the corresponding per hour higher vehicle volume minor street approach (one direction only) for one hour (any four consecutive 15-minute periods) fall above the applicable curves in California MUTCD Figure 4C-3 or 4C-4.

- a. Assumes no carpooling or public transit; actual numbers may be lower in columns 3, 5, and 6.
- b. Associates work 7-8 hour shifts with a 30-minute meal break generally taken onsite.
- c. Delivery vans depart in groups of 50, 50, 50, and 35 between 10:30 a.m. - 12:30 p.m.
- d. Delivery vans return between 7-9 hours after departure between 5:30 p.m. and 9:30 p.m.
- e. Assumes approximately 10 flex drivers will return with packages that could not be delivered; the actual return rate may be lower.
- f. Assumes 3 customers pick up packages in the morning hours and 3 in the evening hours.
