## ATTACHMENT A – RESIDENTIAL NEXUS ANALYSIS REPORT

## I. INTRODUCTION

This Summary, Context Materials, and Recommendations report (“Summary Report”) has been prepared by Keyser Marston Associates, Inc. (KMA) to support consideration of updated affordable housing requirements applicable to residential development in the City of Hayward (“City”). This Summary Report provides a concise version of the affordable housing nexus, financial feasibility and other analyses prepared by KMA and provides recommendations for updates to the City’s affordable housing policies.

The Residential Nexus report is included as Attachment A to this Summary Report and provides the technical analyses and documentation to support Hayward’s affordable housing impact fees applicable to residential development.

### A. Hayward’s Existing Affordable Housing Ordinance Requirements

The City of Hayward established its inclusionary program with adoption of an Inclusionary Housing Ordinance in 2003. The City’s program has been amended twice since it was initially adopted, most recently in 2015 when the Affordable Housing Ordinance (AHO) currently in effect was enacted. Following is a description of Hayward’s existing AHO requirements:

#### *Ownership Housing Requirements*

The AHO requires residential for-sale (or ownership) projects of twenty or more units to provide affordable units on-site or pay an in-lieu fee instead. Attached for-sale projects must provide 7.5% of units as affordable and detached projects must provide 10% of units as affordable to households at Moderate Income (up to 120% of Area Median Income).

The program has an in-lieu fee option which, following the 2015 update, is permitted by right. In-lieu fees are set well below the cost of providing units on-site. As a result, most projects comply through payment of fees rather than provide affordable units onsite. The current in-lieu fees are:

- Attached For-Sale Units: \$3.87 per square foot if paid at building permit or \$4.28 per square foot if paid at certificate of occupancy; and
- Detached For-Sale Units: \$4.61 per square foot if paid at building permit or \$5.06 per square foot if paid at certificate of occupancy.

#### *Rental Housing Requirements*

The AHO requires rental projects of twenty or more units to pay an impact fee of \$3.63 per square foot (or \$3.99 per square foot if paid at certificate of occupancy). Rental projects have the option to provide affordable units on-site as an alternative to payment of the impact fee. The on-site alternative is to provide 7.5% of units as affordable or 10% for detached rental projects. On-site affordable units must be split between Low and Very Low units.

## **B. Context for Update to Hayward's Program**

Rising home prices and rents over the last several years have helped strengthen the housing market in Hayward to the point where the City is now experiencing development activity across a range of residential housing types including new single-family, townhomes, apartments and condominium units. At the same time, the escalation in prices and rents has exacerbated housing affordability challenges. Since Hayward last amended its requirements in early 2015, several other communities in the East Bay have adopted new or updated affordable housing requirements or have begun the process of considering them. These include Fremont, Union City, Oakland and Berkeley. With these recent trends as context and Hayward's requirements now at the low end of the range for cities in the inner East Bay, we understand the City wishes to consider strengthening the requirements of the AHO. The analysis and recommendations summarized in this report have been prepared to support consideration of updated affordable housing requirements applicable to residential development in Hayward.

*Pending Legislation (AB 1505)* – California communities have not had the ability to apply inclusionary requirements to rental projects since the 2009 *Palmer* case (*Palmer/Sixth Street Properties L.P. v. City of Los Angeles* [2009] 175 Cal. App. 4th 1396), described further in Attachment A. On Friday September 15<sup>th</sup>, the California legislature sent AB 1505 to the Governor's desk. If signed by the Governor, the bill will restore the ability to require on-site affordable units within rental projects.

## **C. Organization of this Report**

This report is organized into the following sections:

- Section I provides an introduction;
- Section II presents a summary of KMA's findings and recommendations;
- Section III summarizes the nexus analysis;
- Section IV presents analyses and materials prepared to provide context for policy decisions, including:
  - a. Financial Feasibility Analysis – presents the analysis and findings of the real estate financial feasibility analysis covering four types of residential development in Hayward;
  - b. On-site compliance cost analysis – analysis of the forgone revenue experienced by market rate residential projects in complying with the City's inclusionary policy;
  - c. Residential affordable housing requirements in other jurisdictions – provides a summary of existing inclusionary and impact fee requirements for 18 jurisdictions in Alameda and Santa Clara counties;
- Attachment A is the full Residential Nexus Analysis report.

## II. SUMMARY OF FINDINGS AND RECOMMENDATIONS

In this section, KMA provides a summary of the analysis findings and recommendations for updates to the City's Affordable Housing Ordinance. Recommendations reflect consideration of the following factors:

1. The findings of the nexus analysis. The nexus study establishes the maximum fee that may be charged to mitigate the impacts of new development on the need for affordable housing. Impact fees for rentals are limited to the maximums identified by the nexus. For-sale inclusionary requirements are generally not bound by nexus findings, but cannot be so high as to be confiscatory or to constitute a taking.
2. The City's policy objectives specified in the Housing Element.
3. The current requirements in neighboring jurisdictions.
4. Setting requirements high enough to support a meaningful contribution to affordable housing in Hayward.
5. Setting requirements low enough to not discourage development.

### A. Summary of Findings

The following section provides an overview of KMA's analysis and factors that were considered in developing recommendations for updates to the City's Affordable Housing Ordinance.

#### 1. Nexus Analysis Findings

The findings of the residential nexus analysis are summarized below. The findings per square foot refer to net residential area (exclusive of parking, corridors and other common areas).

	<i>Single Family Detached</i>	<i>Townhome</i>	<i>Condominium</i>	<i>Apartments</i>
Per Market Rate Unit	\$72,200	\$63,400	\$44,900	\$40,400
Per Square Foot	\$28.90	\$31.80	\$44.90	\$44.90

Source: Keyser Marston Associates, Attachment A Residential Nexus Analysis.

KMA recommends impact fees for rentals and in-lieu fees for small projects be set below the nexus findings shown above. While in-lieu fees for for-sale developments are not legally bound by nexus findings, for feasibility reasons KMA recommends they also be set below these levels.

#### 2. Affordable Housing Requirements in Other Jurisdictions

KMA has assembled and summarized affordable housing requirements for 18 jurisdictions in Alameda and Santa Clara counties. These materials were assembled in 2016 for purposes of a

multi-jurisdiction nexus study in which Hayward participated for purposes of the non-residential scope of services only and have been partially updated. Following is a condensed version focusing on selected comparisons. A complete summary is provided in Section IV at the end of this report.

*Rentals: Overview of Adopted Rental Housing Impact Fees in Alameda County*

The chart below shows selected examples of cities in Alameda County that have adopted impact fees for rental development following the 2009 Palmer decision (which eliminated the ability to apply inclusionary requirements to rental projects). There is a wide range in fee levels for rental projects and fees are expressed differently by jurisdiction, with some fees levied on a per market rate unit basis and others on a per square foot basis. Hayward’s fees are well below levels in the other cities.

In Hayward, the minimum size project subject to the fee is 20 units while Oakland’s and Union City’s pending requirements will apply to projects of all sizes. Fremont’s fees apply to projects with two or more units and Berkeley’s to projects with five or more units.

<b>Table 2 – Impact Fees in Other Jurisdictions – Rental Units</b>		
<i>City</i>	<i>Impact Fee</i>	<i>Min. Project Size Subject to Fee</i>
Hayward	\$3.63/sq. ft.*	20 units
Fremont	\$17.50/sq.ft.	2 units
Union City	\$14 / Square Foot (Year 3 full phase-in level)**	1 unit
Berkeley	\$34,000 per unit if paid at building permit or \$37,000 per unit if paid at certificate of occupancy.	5 units
Oakland	\$12,000 to \$22,000 per unit (varies by zone)	1 unit

See Table 17 for more detail. Data is current as of the time of the survey in 2016 with partial updating in 2017.

\* If paid at building permit. An additional 10% is added if the developer elects to pay at certificate of occupancy.

\*\*Council directed staff to prepare an ordinance consistent with the requirements outlined above; however, the changes to the program reflected in this summary are not yet adopted.

*Ownership Affordable Housing Requirements*

For ownership projects, the most common onsite requirement is 15% with Alameda, Albany, San Leandro, and Union City all at this level. Berkeley is higher at 20%; Oakland has two options: 5% at Very Low or 10% at Low to Moderate. Fremont uses an approach that combines both an on-site requirement and an impact fee. The majority of programs allow in-lieu fee payment as an alternative to providing units on-site, Hayward included. Hayward’s current in-lieu fees are at the low end of the range of the surveyed programs. San Leandro, Albany and Alameda allow in-lieu fee payment for small projects only.

<b>Table 3 – Ownership Unit Affordable Housing Requirements in Other Jurisdictions</b>				
<i>City</i>	<i>Affordable Units Required (Percent)</i>	<i>Affordability Level</i>	<i>Fee In-Lieu of Providing Units</i>	<i>Fee by Right?</i>
Hayward	7.5% (attached) 10% (detached)	Moderate	\$3.87* psf (attached) \$4.61* psf (detached)	Yes
Albany	15%	½ Low and ½ Very Low	(Market Value – Affordable Price) * Units Owed	5 & 6 unit projects only
San Leandro	15%	60% Moderate, 40% Low	(Median Sale Price – Affordable Price) * Units Owed	Projects of 2 to 6 units only
Union City	15%	60% Moderate, 30% Median, 10% Low	City Council direction**: \$22 psf (Year 2 full phase-in level)	Yes**
Alameda	15%	47% Moderate, 27% Low, 27% Very Low	\$19,076 per residential unit	Projects under 10 units only
Oakland	Option A: 5% Option B: 10%	Option A: Very Low Option B: Low – Moderate	MF: \$12-\$22,000 / unit SF: \$8-\$23,000 / unit	Yes
Berkeley	20%	Low	62.5% * (Sale Price – Aff. Price) * units owed	Yes
Dublin	7.5% plus fee 12.5% w/o fee	60% Moderate, 40% Low	\$127,061 / affordable unit owed	Yes (partial)
Fremont	Attached 3.5% + fee  Detached: 4.5% + fee	Moderate	With on-site units: Attached: \$18.50 psf Detached: \$17.50 psf  If no on-site units: Attached: \$27 psf Detached: \$26 psf	Yes
Pleasanton	MF: 15% SF: 20%	MF: Low SF: Moderate	MF: \$2,783 /unit SF <1,500 sf: \$2,783/unit SF >1,500 sf: \$11,228/unit	Yes

MF: Multi-family; SF: Single family

See Table 17 for more detail. Data is current as of the time of the survey in 2016 with partial updating in 2017.

\* If paid at building permit. An additional 10% is added if the developer elects to pay at certificate of occupancy.

\*\*Council directed staff to prepare an ordinance consistent with the requirements identified above; however, changes to the program are not yet adopted.

### **3. Market Context**

Hayward has a range of residential product types in the development pipeline and currently marketing including single family, townhomes, apartments and stacked condominiums. New residential development is occurring along the Mission Boulevard corridor, on opportunity sites in the Downtown and in other locations throughout the City where developers have been able to assemble sites.

Pricing has risen significantly over the past several years on the strength of the regional economy, low mortgage rates, and limited housing supply. A new prototypical single family detached home 2,500 square feet in size can now be expected to sell for \$950,000 or \$380 per

square foot. Prototypical attached townhome units are smaller but sell for more on a per square foot measure estimated at \$400 per square foot. Higher density stacked condominiums are still an emergent project type although there are now two such projects under development review (Matyas Village and Mission Seniors), one of which is a senior project.

The rental market in Hayward is showing signs of strength. There is one recently built rental project near the South Hayward BART station and four more rental projects in the development pipeline (Maple and Main, Lincoln Landing, Campways and Haymont Village). A prototypical 900-square foot apartment in a newly developed rental project is now estimated to rent for \$2,800 per month.

See Appendix A to the Residential Nexus Analysis for more detail and supporting data.

#### **4. Financial Feasibility**

KMA tested the financial feasibility of four types of residential development projects in Hayward including single family detached, townhome/attached, apartments and stacked flat condominiums. The analysis indicates that single family, townhomes and apartments are all currently feasible. The significant number of residential projects in the City's new development pipeline is also an indication of financial feasibility. The stacked flat condominium prototype is the only prototype where feasibility was found to be somewhat marginal at this time.

Even in a strong market, rising land costs tend to absorb any "surplus" projects may have in their pro formas; however, the market is able to adjust to new costs such as increased affordable housing requirements in a variety of ways. One way that markets can adjust is through downward pressure on land prices created when developers price new requirements into the economics of their projects and adjust what they can afford to pay for land. When market prices and rents are rising, this condition also helps projects absorb the cost associated with new or increased requirements.

KMA used the pro forma analysis to test three scenarios with increased affordable housing requirements representing a cost of \$10/square foot, \$15/square foot and \$20/square foot. As one example, a \$15/square foot requirement could be absorbed by increases in sale prices and rents in the range of 1.6% for the apartment prototype and 2.8% for the townhome prototype.

<b>Table 4 – Overview of Financial Feasibility Analysis Findings</b>				
<i>Prototype</i>	<i>Single Family Detached</i>	<i>Townhome/ Attached</i>	<i>Condominiums</i>	<i>Apartments</i>
<b>Feasibility Conclusion</b> with existing requirements	Feasible	Feasible	Marginally Feasible	Feasible
Supported Land Value (\$/acre)	\$1,457,000	\$1,556,000	\$1,322,500	\$2,174,000
<b>Market Rent / Sales Price Increase Sufficient to Absorb Updated Requirements</b>				
Representing Cost of \$10/SF	1.4%	1.5%	1.0%	0.9%
Representing Cost of \$15/SF	2.7%	2.8%	1.9%	1.6%
Representing Cost of \$20/SF	4.1%	4.0%	2.7%	2.3%
<b>Land Value Decrease to Absorb Updated Requirements</b>				
Representing Cost of \$10/SF	9%	16%	14%	16%
Representing Cost of \$15/SF	18%	29%	26%	28%
Representing Cost of \$20/SF	26%	41%	37%	41%

Note: adjustments would each be independently sufficient to absorb increased requirements.

See Section IV. A. for the full range of scenarios that were tested.

## B. Program Recommendations

The City has had an inclusionary housing program in place since 2003 and has updated its requirements on two prior occasions. The analyses and information generated in this work program will be helpful to the City in updating the program to respond to the current strong conditions in the local housing development market coupled with deepening affordability challenges. Following are KMA recommendations, based on consideration of local market conditions, the real estate financial feasibility analysis, nexus analysis results, requirements in neighboring cities, our understanding of the City's policy objectives, and other factors.

### *Ownership Program Recommendations:*

- a. *Requiring or Encouraging On-site Affordable Units* – We understand the City would like to encourage more projects to provide affordable units on-site rather than receive in-lieu fees. Two primary approaches for accomplishing this in for-sale projects are to:
  - Require on-site units and remove the option of paying an in-lieu fee, or
  - Increase fees to the point where the decision to provide affordable units on-site becomes financially advantageous for the developer relative to fee payment.

KMA recommends requiring affordable units be provided on-site within for-sale projects of 10 units or more and removing the option to pay an in-lieu fee except for specific project types as described in c. below. We understand inclusion of units onsite within new development projects to be a core City objective of the AHO update and eliminating the in-lieu fee option would be the surest way to achieve this outcome.

- b. *Affordable Unit Percentage* – KMA recommends making on-site affordable unit percentage requirements consistent for attached and detached units and setting the requirement at no more than 10%. The cost associated with providing onsite affordable units is similar for single family detached and attached townhomes on a per square foot basis. This 10% recommendation is estimated to equate to a developer cost in the range of \$20 to \$21 per square foot for prototypical single family and townhome units. Based on the findings of the feasibility analysis, these increased requirements could be absorbed with a relatively modest 4% further improvement in the for-sale market in Hayward. Section IV B. provides additional information if the City would like to consider adjustments to affordable unit pricing from the current 110% of AMI requirement.

While we recognize some neighboring jurisdictions have higher percentage requirements than recommended for Hayward, including several at 15%, it is useful to keep in mind the following additional background in drawing comparisons: a) Union City's 15% requirement has a fee option that costs less than providing the units onsite

and b) in San Leandro our general understanding is that there has been limited development activity to evidence feasibility of the City's mandatory 15% onsite requirement.

c. *Adjustments to Requirements for Specific Project Types* – the following describes recommendations for application of modified requirements to several specific project types:

- *Larger Lot Single Family* - The City may wish to consider allowing fee payment for certain single family projects, such as those above a lot size threshold. Providing affordable units onsite within single family projects is often costlier on a per affordable unit basis, especially those with larger lots and higher priced units. Larger lot single family units are also more likely to be built in areas less accessible to transportation, services and amenities; therefore, these projects may be less desirable locations for affordable units to be provided onsite. Allowing fee payment for larger lot single family projects would allow the City to maintain a source of local funding that may be leveraged with outside funding sources to produce a greater number of affordable units than could be provided onsite within larger lot single family home developments. While selection of a threshold is a matter of policy preference; we suggest consideration of a lot size of +/- 4,000 square feet and higher for allowing fee payment.
- *Higher Density Condos* – Condominiums at higher densities, such as over 35 units per acre, currently face feasibility challenges relative to other for-sale development types and the market for these projects in Hayward remains unproven. The cost to provide affordable units onsite in a higher density condo project is also estimated to be 20% higher on a per square foot basis than for townhomes. If the City would like to encourage this development type, we recommend lower percentage requirements of up to 7.5% consistent with KMA's recommendations for rental projects and / or allowing fee payment for these projects.

d. *In-lieu Fee Level* – Where permitted, KMA recommends consideration of an increased in-lieu fee in the range of \$15 to \$20 per square foot. A requirement at this level would bring Hayward nearer to, but still below, what other jurisdictions in the East Bay such as Union City and Fremont require. Selection of a fee at the upper end of this range would represent an equivalent cost to the maximum on-site requirements recommended above. While there are other viable alternatives for structuring fees, our suggestion is to continue the existing approach of charging fees on a per square foot basis. This is a common approach, is simple to administer, and ensures fees are kept proportionate to unit size, with small units paying less and large units paying more.

- e. *Project Size Thresholds* – The 20-unit minimum project size subject to the City’s AHO is among the highest thresholds in the East Bay. The nexus analysis allows the City to consider fees that apply to small projects and even single units. KMA recommends consideration of a threshold of 2 units for projects to become subject to fees and a threshold of 10 units for applicability of the on-site build requirement, which is the minimum project size for which a whole affordable unit would be owed with a 10% affordability requirement (this 10-unit threshold should be adjusted if a different onsite percentage is selected). Allowing in-lieu fee payment for small projects with 9 or fewer units avoids placing a disproportionate burden on small projects for which percentage requirements would result in less than a full affordable unit being owed.

A step up of fees for projects with 2 to 9 units is recommended to avoid creating a disincentive for small multi-unit projects. One potential formula-based approach to a step up is identified below. The formula is equivalent to exempting the first unit in the project based on the average-sized unit.

$\text{Applicable PSF fee} = \text{Full PSF Fee} \times (\text{No. Units} - 1) / (\text{No. of units}).$
--

*Rental Program Recommendations:*

Under the existing AHO, rental projects must pay an impact fee or may elect to voluntarily provide 7.5% affordable units to mitigate their impact, rather than pay the impact fee. AB 1505, which passed the State Legislature on September 15<sup>th</sup>, would restore the ability to implement inclusionary requirements for rental projects if the bill is signed into law by the Governor. Following are recommendations for updates to the AHO if AB 1505 becomes law as well as under existing law.

- a. *AB 1505 becomes law* - In the event AB 1505 is signed into law, the City will have the ability to make onsite affordable units mandatory in rental projects. This is recommended if the City has a very strong preference for units to be provided onsite over fees which could be combined with tax credits and other sources to assist all affordable projects. If the onsite requirement becomes mandatory, based on the feasibility analysis, KMA recommends considering modifications to bring the cost of complying with requirements to no more than approximately \$20 per square foot. The current 7.5% onsite option at Low and Very Low-Income is estimated to cost projects approximately \$27 per square foot to provide. Two possible options for reducing compliance costs to within the \$20 per square foot range are to a) allow rents to be set at up to 80% of AMI, a level few affordable rentals serve because it is above the rent level allowed for projects with tax credit financing, or b) reduce the percentage requirement to between 5% and 6% while maintaining the existing income level. We recommend continuing to allow fee payment in rental projects below a threshold size in the range of, say, +/- 100 units to avoid getting

small numbers of affordable rental units in scattered locations that could increase the administrative burden of enforcing affordability covenants. Administrative burden associated with scattered units is more of an issue with rental than for-sale because compliance monitoring occurs regularly, not just upon resale as with ownership units. For projects below this threshold, KMA recommends fees be set in the \$15 to \$20 per square foot range, consistent with ownership units.

- b. *Existing law* – If AB 1505 is not signed by the Governor, the City could seek to encourage voluntary provision of onsite units by implementing one of the two options for reducing the cost of compliance described above in combination with an increase to the impact fee level. Depending on how strong of an incentive for onsite units the City wishes to create, impact fees could be set from \$20 per square foot anywhere up to the maximum supported by the nexus study. For projects under a threshold size of, say, +/- 100 units, we recommend fees be limited to \$15 to \$20 per square foot to avoid incentivizing provision of small numbers of onsite affordable rental units in scattered locations which could increase the administrative burden of enforcing affordability covenants.

If the City prefers to keep fees in line with other jurisdictions and does not see on-site units as a priority in rental projects, then a lower fee in the \$10 to \$15 psf range could be a better fit. A fee in the \$10 to \$15 psf range would place Hayward's requirements in the same range as Union City's at \$14 per square foot and comparable to levels adopted by Oakland of \$12,000 per unit at full phase applicable to the southern portion of the City which is equivalent to \$13 per square foot for a 900 SF apartment.

- c. *Project Size Threshold* – Move to a lower threshold for application of requirements, such as two units, consistent with KMA recommendations for the ownership program.

Since the above recommendations represent a significant increase in the affordability obligations of new residential projects, KMA recommends a provision to avoid negatively impacting projects currently in the pipeline. Two potential approaches are a phase-in and grandfathering. With a phase in approach, requirements could be phased in incrementally. With grandfathering, the City could elect to apply requirements in place as of the time projects reach a certain stage in the process, such when an application is deemed complete. City staff have indicated the grandfathering method offers the best continuity with past City practices.

### III. SUMMARY OF NEXUS ANALYSIS

This section provides a concise summary of the residential nexus analysis prepared for the City of Hayward. The analysis provides documentation necessary for adoption of updated affordable housing impact fees applicable to residential development. The analysis establishes maximum supportable impact fee levels based on the impact new residential development has on the need for affordable housing. Findings represent the results of an impact analysis only and are not recommended fee levels.

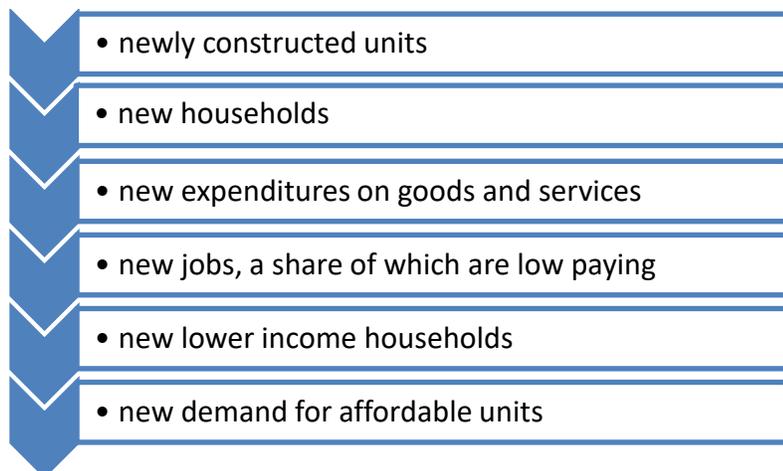

Nexus findings represent upper limits for impact fees for rental housing. However, inclusionary housing requirements on for-sale housing, including those that give the developer the option of paying an in-lieu fee, are not required to be justified by nexus studies, although they cannot be ‘confiscatory,’ based on the 2016 ruling by the California Supreme Court in the San Jose inclusionary zoning case.

Full documentation of the analyses can be found in the report titled Residential Nexus Analysis included as Attachment A.

#### A. Residential Nexus Analysis Summary

The residential nexus analysis establishes maximum supportable impact fee levels applicable to residential development. The underlying concept of the residential nexus analysis is that the newly constructed units represent net new households in Hayward. These households represent new income in the City that will consume goods and services, either through purchases of goods and services or “consumption” of governmental services. New consumption generates new local jobs; a portion of the new jobs are at lower compensation levels; low compensation jobs relate to lower income households that cannot afford market rate units in Hayward and therefore need affordable housing.

#### Nexus Analysis Concept

## 1. Market Rate Residential Prototypes

In collaboration with City staff, a total of four market rate residential prototypes were selected: three ownership prototypes and one rental prototype. The intent of the selected prototypes is to identify representative development prototypes likely to be developed in Hayward in the immediate to mid-term future.

A summary of the four residential prototypes is presented below. Market survey data, City planning documents and other sources were used to develop the information. Market sales prices and rent levels were estimated based on KMA's market research.

	<i>Single Family</i>			
	<i>Detached</i>	<i>Townhome</i>	<i>Condominium</i>	<i>Apartments</i>
Avg. Unit Size	2,500 SF	2,000 SF	1,000 SF	900 SF
Avg. No. of Bedrooms	4.00	3.50	2.00	1.50
Avg. Sales Price / Rent Per Square Foot	\$950,000 \$380 /SF	\$800,000 \$400 /SF	\$590,000 \$590 /SF	\$2,800 /mo. \$3.11 /SF

## B. Household Expenditures and Job Generation

Using the sales price or rent levels applicable to each of the four market rate residential prototypes, KMA estimates the household income of the purchasing/renting household. Household income is then translated to income available for expenditures after deducting taxes, savings and household debt, which becomes the input to the IMPLAN model. The IMPLAN model is used to estimate the employment generated by the new household spending. The IMPLAN model is an economic model widely used for the past 35 years to quantify the impacts of changes in a local economy. For ease of presentation the analysis is conducted based on an assumed project size of 100 market rate units.

A 20% downward adjustment is made to the IMPLAN employment estimates based on the expectation that a portion of jobs may be filled by existing workers who already have housing locally. The 20% adjustment is based upon job losses in declining sectors of the local economy over a historic period. "Downsized" workers from declining sectors are assumed to fill a portion of the new jobs in sectors that serve residents.

The translation from market rate sales prices and rent levels for the prototypical units to the estimated number of jobs in sectors such as retail, restaurants, health care and others providing goods and services to new residents is summarized in the table below.

<b>Table 6 – Household Income, Expenditures, Job Generation, and Net New Worker Households</b>				
	<i>Single Family</i>			
	<i>Detached</i>	<i>Townhome</i>	<i>Condominium</i>	<i>Apartments</i>
Avg. Sales Price / Rent	\$950,000	\$800,000	\$590,000	\$2,800
Gross Household Income	\$187,000	\$162,000	\$121,000	\$117,000
Net Annual Income available	\$125,300	\$110,200	\$82,300	\$74,000
Total Jobs Generated [from IMPLAN] (100 Units)	93.0	81.8	58.2	52.3
Net New Jobs after 20% reduction for declining industries (100 units)	74.4	65.4	46.5	41.9

See Attachment A Residential Nexus Analysis for full documentation.

### **C. Compensation Levels of Jobs and Household Income**

The output of the IMPLAN model – the numbers of jobs by industry – is then entered into the Keyser Marston Associates jobs housing nexus analysis model to quantify the compensation levels of new jobs and the income of the new worker households. The KMA model sorts the jobs by industry into jobs by occupation, based on national data, and then attaches local wage distribution data to the occupations, using recent Alameda County data from the California Employment Development Department (EDD). The KMA model also converts the number of employees to the number of employee households, recognizing that there is, on average, more than one worker per household, and thus the number of housing units in demand for new workers is reduced. For purposes of the adjustment from jobs to housing units, the average of 1.62 workers per working household in Alameda County is used.

<b>Table 7 – Adjustment from No. of Workers to No. of Households</b>				
	<i>Single Family</i>			
	<i>Detached</i>	<i>Townhome</i>	<i>Condominium</i>	<i>Apartments</i>
Net New Jobs (100 Units)	74.4	65.4	46.5	41.9
Divide by No. of Workers per Worker Household	1.62	1.62	1.62	1.62
Net new worker households (100 Units)	45.9	40.3	28.7	25.8

The output of the model is the number of new worker households by income level (expressed in relation to the Area Median Income, or AMI) attributable to the new residential units and new households in Hayward. Four categories are addressed: Extremely Low (under 30% of AMI), Very Low (30% to 50% of AMI), Low (50% to 80% of AMI) and Moderate (80% to 120% of AMI).

Following are the numbers of worker households by income level associated with the Hayward prototype units.

<b>Table 8 – New Worker Households per 100 Market Rate Units</b>				
	<i>Single Family</i>			
	<i>Detached</i>	<i>Townhome</i>	<i>Condominium</i>	<i>Apartments</i>
Extremely Low (0%-30% AMI)	5.1	4.5	3.2	2.9
Very Low (30%-50% AMI)	11.8	10.4	7.4	6.6
Low (50%-80% AMI)	12.2	10.8	7.6	6.8
Moderate (80%-120% AMI)	7.4	6.5	4.6	4.1
<b>Total, Less than 120% AMI</b>	<b>36.6</b>	<b>32.2</b>	<b>22.8</b>	<b>20.5</b>
Greater than 120% AMI	9.3	8.2	5.9	5.3
<b>Total, New Households</b>	<b>45.9</b>	<b>40.3</b>	<b>28.7</b>	<b>25.8</b>

See Attachment A Residential Nexus Analysis for full documentation.

Housing demand is distributed across the lower income tiers. The finding that the greatest number of households occurs in the Very Low and Low income tiers is driven by the fact that a large share of jobs most directly associated with consumer spending tend to be low-paying, such as food preparation, administrative, and retail sales occupations.

#### **D. Nexus Supported Maximum Fee Levels**

The next step in the nexus analysis takes the number of households in the lower income categories associated with the market rate units and identifies the total subsidy required to make housing affordable. This is done for each of the prototype units to establish the ‘total nexus cost,’ which is the Maximum Supported Impact Fee conclusion of the analysis. For the purposes of the analysis, KMA assumes that affordable housing fee revenues will be used to subsidize affordable rental units for households earning less than 80% of median income, and to subsidize affordable ownership units for households earning between 80% and 120% of median income. Affordability gaps are calculated for each of the income tiers; the nexus costs are calculated by multiplying the affordability gaps by the number of households in each income level.

The Maximum Supported Impact Fees are calculated at the per-unit level and the per-square-foot level and are shown in the table below.

<b>Table 9 – Maximum Supported Residential Impact Fees, City of Hayward</b>				
	<i>Single Family</i>			
	<i>Detached</i>	<i>Townhome</i>	<i>Condominium</i>	<i>Apartments</i>
Per Market Rate Unit	\$72,200	\$63,400	\$44,900	\$40,400
Per Square Foot*	\$28.90	\$31.80	\$44.90	\$44.90

\* Applies to net rentable / sellable area exclusive of garage space, external corridors and other common areas.

These costs express the maximum supported impact fees for the four residential prototype developments in Hayward. These findings are **not** recommended fee levels.

## IV. CONTEXT MATERIALS

The purpose of this section is to provide information that may be useful to policy makers in considering potential amendments to the City's affordable housing requirements for residential development and potential adoption of a new affordable housing impact fee applicable to non-residential development. The following analyses and summary materials are included:

- **Real Estate Financial Feasibility Analysis** – Section A. presents the analysis and findings regarding the financial feasibility of new market rate residential development;
- **Inclusionary Program Compliance Costs** – Section B. analyzes the cost to a market rate residential project of complying with the City's existing inclusionary policy;
- **Residential Affordable Housing Requirements in Other Jurisdictions** – Section C. provides a summary of inclusionary and impact fee requirements in other jurisdictions;

### A. Real Estate Financial Feasibility Analysis

In adopting or amending affordable housing requirements, cities typically consider a variety of public policy goals including seeking a balance between producing a meaningful amount of new affordable units and establishing requirements at a level that can be sustained by new market rate projects. This section addresses the potential impacts that new affordable housing fees could have on the feasibility of new development projects.

Before describing the feasibility analysis, it is useful to put the feasibility analysis into perspective by summarizing how it can be used and where limitations exist in its ability to inform a longer-term policy direction:

- *Prototypical Nature of Analysis* – This financial feasibility analysis, by its nature, can only provide a general assessment of development economics because it is based on prototypical projects rather than specific projects. Every project has unique characteristics that will dictate sale prices and rents supported by the market as well as development costs and developer return requirements. This feasibility analysis is intended to reflect prototypical residential projects in Hayward but it is recognized that the economics of actual projects will differ to some degree from those of the prototypes analyzed.
- *Near Term Time Horizon* – This feasibility analysis is a snapshot of real estate market conditions as of mid-year 2017. The analysis is most informative regarding near term implications updated affordable housing requirements could have for projects that have already purchased sites and are currently in the pre-development stages. Real estate development economics are fluid and are impacted by constantly changing conditions

regarding sale price and rent potential, construction costs, land costs, and costs of financing. A year or two from now, conditions will undoubtedly be different to some degree.

- *Adjustments to Land Costs over Time* – Developers purchase development sites at values that will allow for financially feasible projects. If housing requirements are updated, developers will “price in” the updated requirement when evaluating a project’s economics and negotiating the purchase price for development sites. Given that the requirements will apply to all or most projects, it is possible that downward pressure on land costs could result as developers adjust what they can afford to pay for land. This downward pressure on land prices can bring costs back into better balance with the overall economics supported by projects.

### *Market Context*

Like most parts of the Bay Area, Hayward has experienced improving residential market conditions in recent years as exhibited by rapidly rising home prices and apartment rents and new development activity. The improvement in market conditions is attributable to robust regional job growth and the overall strength of the regional economy. It is also acknowledged that, while home prices and apartment rents have grown significantly, the strong real estate market has also had the offsetting effect of driving construction cost inflation.

### *Financial Feasibility Analysis*

The financial feasibility analysis estimates the costs to develop new residential projects and the sale revenues or rental income that could be generated by the projects upon completion. If the revenues are sufficient to support the development costs and to generate a sufficient profit margin, the project is considered feasible. This approach to financial feasibility, known as a pro forma approach or income approach, is common practice in the real estate industry and is utilized in one form or another by all developers when analyzing new construction projects.

This analysis organizes the pro forma as a “land residual analysis”, meaning the pro forma solves for what the project can afford to pay for a development site based on the revenue projections and the non-land acquisition costs of the project. It then compares the residual land values with land costs in the current market in order to test whether developers can afford to buy land and develop projects. The following describes the assumptions utilized in the analysis and the conclusions drawn therefrom.

- The direct construction costs of development include all contractor labor and material costs to construct the project including general requirements, contractor fees, and contingencies. As shown in Table 10 below, the direct construction costs are estimated to range from \$296,300/unit for the apartment prototype to \$462,500/unit for the single

family detached prototype. These estimates have been made based on third party construction data sources, such as RS Means, and by cost estimates for similar building types elsewhere in the market. Indirect costs of development include architecture and engineering (A&E) costs, municipal fees and permits costs, taxes, insurance, overhead, and financing costs. The fees and permits cost estimates include Hayward's current affordable housing fees of \$4.61, \$3.87, and \$3.63/square foot for the single family detached prototype, attached for-sale prototypes (townhomes and condos) and rental apartment prototype respectively.

- Market rate sale prices have been estimated to range from \$590,000/unit for the stacked flat condominium prototype to \$950,000/unit for the single family detached prototype.
- Rental income for the apartment prototype has been estimated at \$2,800/month, or \$3.11/square foot/month. After a vacancy factor, operating expenses, and property taxes, the net operating income (NOI) has been estimated at \$21,730/unit/year. Using this NOI and applying a 5.2% project return, the project value/supported investment is estimated at \$418,000/unit.
- The residual land value is derived by subtracting the development costs before land acquisition from the project value/supported investment. As shown in Table 10, the residual land values range from \$26,400/unit to \$145,600/unit and from \$1.32 million to \$2.17 million/acre.

Once the residual land values have been estimated, the values can be compared to prevailing land values in the market to determine whether the prototypes are financially feasible. In other words, if the residual land values are equal to or higher than market land values, then projects are generally feasible. Conversely, if the residual land values are less than market land values, some improvement in market conditions (lower development costs or higher housing values) will likely be needed for feasibility.

**Table 10 – Summary of Residual Land Value Analysis**

<i>Prototype</i>	<i>Single Family Detached</i>	<i>Townhome/ Attached</i>	<i>Condominiums</i>	<i>Apartments</i>

<sup>(1)</sup> Net Supported Investment after sales commissions and profit margin with for-sale prototypes; after vacancy, operating expenses, and profit margin for apartment prototype. See Tables 13 and 14 for further detail.

### *Prevailing Land Values*

In order to assess prevailing land values for residential development in Hayward, KMA reviewed relevant land sale comparables in Hayward (comps) from 2015 to 2017. The sale prices of these comps ranged from as low as \$32,000/unit to as high as \$120,000/unit. The wide range in per-unit values is largely attributable to the difference in unit sizes and densities among the projects. Based on the fact that some of the land sales reviewed for this analysis occurred in 2015 and 2016, the values for these comps would be expected to be somewhat higher today after accounting for land value appreciation.

**Table 11 – Residential Land Sale Comparables (2015-2017), City of Hayward**

	Address	Sale Date	Acres	Proposed		Sale Price	\$/Acre (rounded)	\$/Unit (rounded)
				Units	DU/Acre

### *Feasibility Conclusion*

Based on the comparison of residual land values to recent land transactions in the market, this analysis concludes that the single family detached, townhome/attached, and apartment prototypes are generally feasible at this time, including payment of the City's current affordable housing fees. The significant number of residential projects in the City's new development pipeline is also an indication of market feasibility. The stacked flat condominium prototype is the only prototype that does not appear to support a land value in line with market transactions. However, a relatively minor adjustment to the estimated average sale price of these units (roughly 3%), would likely bring this prototype within the range of financial feasibility.

### *Potential Market Adjustments to Absorb Increased Requirements*

To illustrate the impacts a potential increase in affordable housing requirements could have to financial feasibility, KMA used the pro forma analysis to test three alternative affordable housing requirements representing a cost of \$10/square foot, \$15/square foot, and \$20/square foot. For purposes of this test it is assumed these fee levels would replace the current fee levels of \$4.61, \$3.87, and \$3.63/square foot (i.e. they would not be additive). Note that while expressed in terms of dollars per square foot, these requirement levels can readily be converted to equivalent cost on-site inclusionary requirements using the information presented in the next section.

Since the feasibility analysis is a snapshot in time analysis based on current market conditions, it can be instructive to consider how relatively modest improvements in project economics (e.g. continued increases in sale prices and rents) can help to absorb increased fees. As one example, a \$15/square foot fee could be absorbed by increases in sale prices and rents in the range of 1.6% for the apartment prototype and 2.8% for the townhome prototype.

**Table 12 – Potential Market Adjustments to Absorb Illustrative Fee / Requirement Cost Levels**

	\$10/SF	\$15/SF	\$20/SF
<u>Single Family Detached Prototype</u>			
Increase in Sale Price	1.4%	2.7%	4.1%
Decrease in Direct Costs	2.9%	5.6%	8.3%
Decrease in Land Values	9.2%	17.8%	26.4%
<u>Townhome/Attached Prototype</u>			
Increase in Sale Price	1.5%	2.8%	4.0%
Decrease in Direct Costs	3.1%	5.6%	8.1%
Decrease in Land Values	15.8%	28.6%	41.5%
<u>Condominium Prototype</u>			
Increase in Sale Price	1.0%	1.9%	2.7%
Decrease in Direct Costs	1.8%	3.3%	4.9%
Decrease in Land Values <sup>[1]</sup>	14.1%	25.6%	37.1%
<u>Apartment Prototype</u>			
Increase in Rents	0.9%	1.6%	2.3%
Decrease in Direct Costs	1.9%	3.5%	5.0%
Decrease in Land Values	15.8%	28.2%	40.7%

*Note: Each of the above adjustments would independently be sufficient to absorb the fee / requirement cost increase. Depending upon the market cycle and other factors, a combination of the above market adjustments might be expected to contribute to absorbing a new fee.*

<sup>[1]</sup> *For the condominium prototype, the decrease in land values is based on the higher land value supported by the apartment prototype, which has a similar density.*

## B. On-Site Compliance Cost Analysis

To assist the City in understanding the cost associated with providing affordable units onsite, KMA estimated the foregone revenue to the developer when units are restricted to affordable prices or rents; this is referred to as the 'onsite compliance cost.' This information is often useful as context when considering potential onsite and fee obligations.

KMA modeled the cost associated with complying with existing AHO requirements by providing affordable units onsite (10% onsite in single family detached projects and 7.5% onsite for attached for-sale and rental projects). In addition, the cost of setting aside each 1% of units as affordable was evaluated to assist in evaluating potential modified onsite requirement levels.

Findings of the compliance cost analysis are summarized in the table below. Supporting analysis is presented on Tables 16A to 16D. As shown, each 1% of units that are made affordable results in forgone revenue to the developer of between \$2.05 and \$3.64 per square foot or between \$2,500 and \$5,200 per unit. Hayward's existing on-site requirement / option equates to a cost of \$15 to \$27 per square foot depending on the prototype, which is far costlier than payment of current in-lieu / impact fees which range from \$3.63 to \$4.61 per square foot.

<b>Table 15 – Onsite Compliance Cost Analysis</b>				
	<i>Single Family Detached</i>	<i>Townhomes</i>	<i>Stacked Condos</i>	<i>Apartments</i>
<b>Affordability Level</b>	Moderate	Moderate	Moderate	50% Low, 50% Very Low
<b>Forgone Revenue Per Affordable Unit Provided</b>	\$524,200	\$409,300	\$247,100	\$328,000
<b>For Each 1% of Units Made Affordable</b>				
Forgone Revenue Per Unit in Project	\$5,242	\$4,093	\$2,471	\$3,280
Forgone Revenue Per Square Foot in Project	\$2.10	\$2.05	\$2.47	\$3.64
<b>Current Onsite Requirement / Option (10% detached, 7.5% attached)</b>				
Forgone Revenue Per Unit in Project	\$52,400	\$30,700	\$18,500	\$24,600
Forgone Revenue Per Square Foot in Project	\$20.96	\$15.35	\$18.50	\$27.33

Tables 16A and 16B provide additional compliance cost findings at 100% AMI for ownership units and 80% of area median income for rental units. Each 1% of units provided at 110% of AMI is approximately equivalent in cost to providing 0.9% of units at 100% of AMI. For rentals, 1% of units split between very low and low are approximately equivalent in cost to provide as 1.36% of units at 80% of AMI.

## **C. Residential Affordable Housing Requirements in Other Jurisdictions**

The affordable housing requirements adopted by other jurisdictions are almost always of interest to decision making bodies. Cities inevitably want to know what their neighbors have in place for affordable housing requirements, and often want to examine other cities that are viewed as comparable on some level. The body of information on other programs not only presents what others are adopting, but also illustrates the broad range in program design and customized features available to meet local needs.

A survey of affordable housing requirements in eighteen jurisdictions was prepared for purposes of the multi-jurisdiction nexus study in which the City of Hayward participated (for purposes of the non-residential scope of services only). The comparison jurisdictions were selected by the participants in that effort. The survey was prepared in 2016 and is incorporated in this report with limited updating.

Table 17 is four-page chart which summarizes the key features of the eighteen cities in the survey. The chart was designed to focus on the major components of each city's program that would be most relevant to decision making, primarily the thresholds, the fee levels and on-site affordable unit requirements.

### **1. Findings from the Survey**

#### *Thresholds for On-Site Affordable Requirement*

- Whether or not for-sale development projects have the choice “as of right” between paying a fee or doing on-site units is a critical feature of any program. In the eight Santa Clara jurisdictions, six require on-site units and offer no fee “buy out” without a special City Council procedure. Only San Jose and Milpitas offer the fee choice at this time. In contrast, of the ten Alameda jurisdictions, most offer fee payment “as of right.”
- Most fee options are less costly to the developer than providing on-site units. High fees are necessary if the choice between building units or paying fees is to be at all competitive. The high fee cities, such as Fremont, aim to present a real choice and achieve some on-site compliance units as well as fee revenues.
- With the loss of redevelopment and tax increment resources dedicated to housing, many cities have revised their programs to generate more fee revenues. Programs can be revised so as to alter options or incentives for projects to provide on-site units versus pay a fee based on the City's preferences.
- The loss of redevelopment has also motivated some cities to lower minimum project sizes to collect fees on very small projects, even single units. Several Santa Clara cities

in the chart have adjusted their thresholds down to three to five units for fee payment, and the recently updated Cupertino and Oakland programs go down to single units as do proposed requirements for Union City. The nexus analysis fully demonstrates the impact generated by single units, and as a result, some cities view charging very small projects and single units a matter of fairness and equity in an “everybody contributes” approach to meeting affordable housing challenges.

- Following the *Palmer* decision, impact fees have been the only avenue for requiring rental projects to mitigate their impacts on the need for affordable housing. On-site affordable units must be allowed as an alternative to fee payment if consistent with the Costa Hawkins Act and provided in exchange for a financial contribution or regulatory incentive such as a density bonus.

### *Fee Levels*

- Impact fee levels for rentals in the cities of north and west Santa Clara County cluster in the \$15 to \$20 per square foot range for rentals, notably San Jose, Mountain View, Sunnyvale, and Cupertino. Most other cities have not yet adopted impact fees on rentals.
- Fees on for sale units, where permitted, in the Santa Clara cities reflect a range of approaches and levels. Several Silicon Valley cities charge fees as a percent of sales price, a practice not used much outside of Silicon Valley. The percent of sales prices reflects the higher impacts of higher priced units, borne out in the nexus analysis. The approach also scales fees in proportion to the revenue projects would forgo were a portion of units to be made affordable on-site.
- In the East Bay, Fremont is notable for its higher fees and obligation to provide both units and pay fees. Oakland is a new adoption that will phase in fees up to \$23,000 per market rate unit. Berkeley recently increased its fees to \$34,000 per unit or add \$3,000 more if paid at certificate of occupancy. In May, the City Council of Union City directed staff to come back with an ordinance at \$22 per square foot for ownership projects and \$14 per square foot for rentals (at full phase-in).
- East of the hills, some programs like Pleasanton, have been in place for decades but are more modest than most of the newer ones. Dublin is, in many ways, its own special case, with vigorous development activity and affordable unit requirements.

### *On-Site Requirements*

- The Santa Clara cities (excluding Milpitas) have programs in the 10% to 20% range, with 15% most common.

- For the Santa Clara County programs, the affordability level applicable to for-sale projects is usually in the moderate income range, with pricing of on-site units ranging from 90% to 120% AMI, depending on the city. A few cities do seek some units down to Low Income.
- In Alameda cities, on-site requirements are most commonly at the 15% level. Berkeley has a 20% requirement, Oakland has both a 5% and a 10% option depending on the depth of affordability. The Fremont percentage is lower but a fee is owed in addition to on-site units.

## **2. Other General Comments**

- Impact / in-lieu fees are presented at adopted levels. Where a multi-year phase-in has been adopted, such as the new Oakland program, the full phase in amount is shown with clarification in the bottom comment section of the chart. Fees on rentals are included only when they have been adopted as impact fees, following the *Palmer* California Supreme Court ruling which precludes on-site requirements and their in-lieu fee alternatives.
- Fees are expressed in different ways from one city to the next. Some fees are charged per square foot, some are a flat fee per market rate unit, and some are charged per affordable unit owed, which is almost always over \$100,000 in the Bay Area. To convert per unit owed to per market rate unit, one can multiply the per unit amount by the percentage requirement.
- On-Site Requirement/Option for Rentals. Many city codes continue to include on-site requirement language for rental projects because codes have not been updated since the *Palmer* ruling and requirements are not being applied. These requirements are not included in the chart.
- The income levels of the affordable units that are required are summarized in terms of both “eligibility” or “qualifying” levels and the pricing level that is used to establish the purchase price or rent level of the unit. The pricing level is the critical one insofar as the developer’s obligation is concerned. The most typical choice for pricing level is to be consistent with the affordable housing cost definitions in the California Health & Safety Code 50052.5 and 50053.
- Virtually all cities that have on-site requirements for for-sale residential projects without the choice of fee payment, do allow fee payment with special City Council approval. Therefore, the chart notes this feature only by way of a footnote. The City’s practice in granting such approvals may be more consequential than what may be written.

For more complete information on the programs, please consult the website and code language of the individual cities.

## I. INTRODUCTION

The following report is a Residential Nexus Analysis, an analysis of the linkages between the development of new residential units and the need for additional affordable housing in the City of Hayward. The report has been prepared by Keyser Marston Associates, Inc. (KMA) pursuant to a contract with the City of Hayward.

### **Background, Context and Use of the Analysis**

The analysis addresses market rate residential projects in Hayward and the various types of units that are subject to the City's Affordable Housing Ordinance (AHO) at this time and potentially in the future. The nexus analysis quantifies the linkages between new market rate units and the demand for affordable housing in Hayward.

The City of Hayward's inclusionary program was first established in 2003 and has been updated twice since it was originally adopted. For-sale projects of twenty or more units are required to provide affordable units on-site or pay an in-lieu fee instead. Attached for-sale projects must provide 7.5% of units as affordable while detached projects must provide 10% of units affordable to households at Moderate Income. The program has an in-lieu fee alternative which is permitted by right.

The requirement for rental projects is to pay an impact fee. Affordable units may be provided on-site as an alternative to paying the impact fee. The on-site option for rental projects is to provide 7.5% of units as affordable split between Low and Very Low-Income units<sup>1</sup>.

Hayward's current fees are:

- *Attached For-Sale Units*: \$3.87 per square foot if paid at building permit or \$4.28 per square foot if paid at certificate of occupancy; and
- *Detached For-Sale Units*: \$4.61 per square foot if paid at building permit or \$5.06 per square foot if paid at certificate of occupancy.
- *Rentals*: \$3.63 per square foot if paid at building permit or \$3.99 per square foot if paid at certificate of occupancy.

The nexus analysis provided herein enables the City to proceed with an update of the housing impact fees applicable to residential development in the City of Hayward. The conclusions of the analysis represent maximum supportable or legally defensible impact fee levels based on the

---

<sup>1</sup> For detached rentals, which are presumably rare, the on-site percentage is 10%.

impact of new residential development on the need for affordable housing. Findings are not recommended fee levels.

It should be noted that requirements applicable to for-sale projects need not be bound by the findings of this nexus analysis in accordance with the ruling in *C.B.I.A.*, described below. For small for-sale projects that would owe less than one onsite affordable unit, it is recommended that in-lieu fees be kept within the nexus maximums given on-site compliance with inclusionary requirements may not be practical and so the fee becomes the primary compliance option. As of this writing, impact fees supported by a nexus study are the only option for implementation of affordable housing requirements for rental projects. This could change if AB 1505 is signed into law by the Governor and restores the ability to implement inclusionary requirements for rental projects.

### **Background on Key Legal Cases**

The following provides background regarding two key legal cases pertaining to inclusionary programs which in recent years have motivated many California cities to undertake residential nexus studies. This section is intended as general background only; nothing in this report should be interpreted as providing specific legal guidance, which KMA is not qualified to provide.

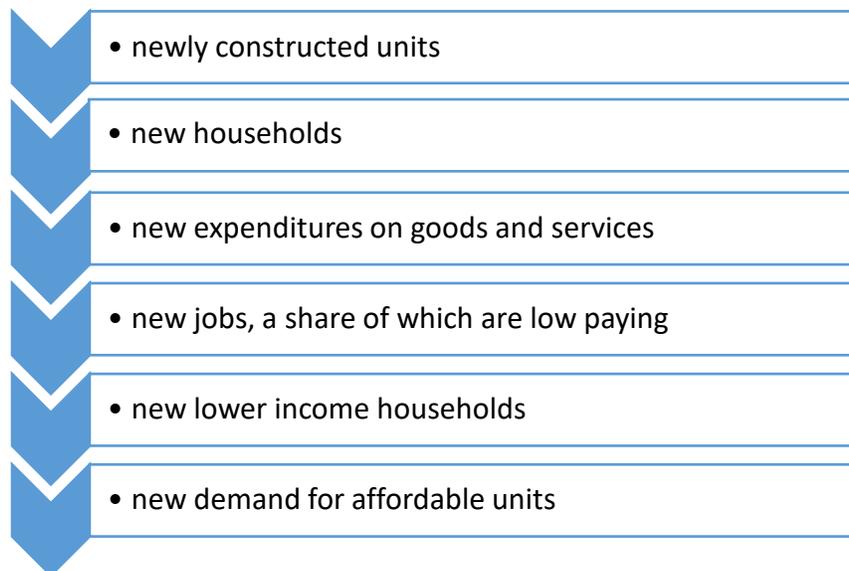

The *Palmer* case (*Palmer/Sixth Street Properties L.P. v. City of Los Angeles* [2009] 175 Cal. App. 4th 1396) was decided in 2009 and precluded California cities from requiring long term rent restrictions or inclusionary requirements on rental units. Since the *Palmer* ruling, many California cities have adopted affordable housing impact fees on rental projects supported by residential nexus studies similar to this one. On September 15<sup>th</sup>, the California legislature sent AB 1505 to the Governor's desk. If signed by the Governor, the bill will restore the ability to require on-site affordable units within rental projects.

In *C.B.I.A.*, (*California Building Industry Association v. City of San Jose*, California Supreme Court Case No. S212072, June 15, 2015), also referred to as the San Jose Case, the California Building Industry Association challenged the City of San Jose's newly adopted inclusionary program. A core contention of C.B.I.A. was that the City's inclusionary program constituted an exaction that required a nexus study to support it. The case was pending in the courts from 2010 through February 2016. Ultimately, the case was decided by the California Supreme Court in favor of the City of San Jose, finding San Jose's inclusionary program to be a valid exercise of the City's power to regulate land use and not an exaction. The U.S. Supreme Court denied C.B.I.A.'s petition to review the case. While the case was pending, there was speculation that the courts would rule in favor of C.B.I.A. and this possibility was one of the motivations for cities to prepare residential nexus studies as an additional "backup" support measure for inclusionary programs.

## The Nexus Concept

A residential nexus analysis demonstrates and quantifies the impact of new market rate housing development on the demand for affordable housing. The underlying nexus concept is that the newly constructed market rate units represent net new households in Hayward. These households represent new income in Hayward that will consume goods and services, either through purchases of goods and services or 'consumption' of government services. New consumption translates to jobs; a portion of the jobs are at lower compensation levels; low compensation jobs relate to lower income households that cannot afford market rate units in Hayward and therefore need affordable housing.

### Nexus Analysis Concept

## Methodology and Models Used

The nexus analysis methodology starts with the sales price or rental rate of a new market rate residential unit, and moves through a series of linkages to the gross income of the household that purchased or rented the unit, the income available for expenditures on goods and services, the jobs associated with the purchases and delivery of those services, the income of the workers doing those jobs, the household income of the workers and, ultimately, the affordability level of the housing needed by the worker households. The steps of the analysis from household income available for expenditures to jobs generated were performed using the IMPLAN model, a model widely used for the past 35 years to quantify the impacts of changes in a local economy, including employment impacts from changes in personal income. From job generation by industry, KMA used its own jobs housing nexus model to quantify the income of worker households by affordability level.

To illustrate the linkages by looking at a simplified example, we can take an average household that buys a house at a certain price. From that price, we estimate the gross income of the household (from mortgage rates and lending practices) and the portion of income available for expenditures. Households will “purchase” or consume a range of goods and services, such as purchases at the supermarket or services at the bank. Purchases in the local economy in turn generate employment. The jobs generated are at different compensation levels. Some of the jobs are low paying and as a result, even when there is more than one worker in the household, there are some lower and moderate-income households who cannot afford market rate housing in Hayward.

The IMPLAN model quantifies jobs generated at establishments that serve new residents directly (e.g., supermarkets, banks or schools), jobs generated by increased demand at firms which service or supply these establishments, and jobs generated when the new employees spend their wages in the local economy and generate additional jobs. The IMPLAN model estimates the total impact combined.

### **Net New Underlying Assumption**

An underlying assumption of the analysis is that households that purchase or rent new units represent net new households in Hayward. If purchasers or renters have relocated from elsewhere in the city, vacancies have been created that will be filled. An adjustment to new construction of units would be warranted if Hayward were experiencing demolitions or loss of existing housing inventory. However, the rate of housing unit removal is so low as to not warrant an adjustment or offset.

On an individual project basis, if existing units are removed to redevelop a site to higher density, then there could be a need for recognition of the existing households in that all new units might not represent net new households, depending on the program design and number of units removed relative to new units.

Since the analysis addresses net new households in Hayward and the impacts generated by their consumption expenditures, it quantifies net new demands for affordable units to accommodate new worker households. As such, the impact results do not address nor in any way include existing deficiencies in the supply of affordable housing.

### **Geographic Area of Impact**

The analysis quantifies impacts occurring within Alameda County. While much of the impact will occur within Hayward, some impacts will be experienced elsewhere in the county and beyond. The IMPLAN model computes the jobs generated within the county and sorts out those that occur beyond the county boundaries. The KMA Jobs Housing Nexus Model analyzes the income structure of jobs and their worker households, without assumptions as to where the worker households live.

In summary, the KMA nexus analysis quantifies all the job impacts occurring within Alameda County and related worker households. Job impacts, like most types of impacts, occur irrespective of political boundaries. And like other types of impact analyses, such as traffic, impacts beyond city boundaries are experienced, are relevant, and are important. See the Addendum: Additional Background and Notes on Specific Assumptions at the end of this report for further discussion.

### **Market Rate Residential Project Types**

Four prototypical residential project types were selected by the City and KMA for analysis in this nexus study. The prototypes were intended to represent the range of product types currently being built in Hayward or which are expected in the future including:

- Single Family Detached;
- Townhome;
- Condominium; and,
- Apartment.

### **Affordability Tiers**

The nexus analysis addresses the following four income or affordability tiers:

- Extremely Low Income: households earning up to 30% Area Median Income (AMI);
- Very Low Income: households earning over 30% AMI up to 50% of AMI;
- Low Income: households earning over 50% AMI up to 80% of AMI; and,
- Moderate Income: households earning over 80% AMI up to 120% of AMI.

### **Report Organization**

The report is organized into the following sections:

- Section A presents information regarding the prototypical new market rate residential units and the estimated household income of purchases or renters of those units.
- Section B describes the IMPLAN model, which is used in the nexus analysis to translate household income into the estimated number of jobs in retail, restaurants, healthcare, and other sectors serving new residents.
- Section C presents the linkage between employment growth associated with residential development and the need for new lower income housing units required in each of the four income categories.
- Section D quantifies the nexus or mitigation cost based on the cost of delivering affordable units to new worker households in each of the four income categories.

- An Addendum section provides a supplemental discussion of specific factors in relation to the nexus concept.
- Appendix A contains the market survey.
- Appendix B includes detailed tables on worker occupations and compensation levels, which are a key input into the analysis.

## **Disclaimers**

This report has been prepared using the best and most recent data available at the time of the analysis. Local data and sources were used wherever possible. Major sources include the U.S. Census Bureau's American Community Survey, California Employment Development Department (EDD) and the IMPLAN model. While we believe all sources utilized are sufficiently sound and accurate for the purposes of this analysis, we cannot guarantee their accuracy. Keyser Marston Associates, Inc. assumes no liability for information from these and other sources.

## **II. RESIDENTIAL NEXUS ANALYSIS**

### **A. Market Rate Units and Household Income**

This section describes the prototypical market rate residential units and the income of the purchaser and renter households. Market rate prototypes are representative of new residential units currently being built in Hayward or that are likely to be built in Hayward over the next five to ten years. Household income is estimated based on the amount necessary for the mortgage or rent payments associated with the prototypical new market rate units and becomes the basis for the input to the IMPLAN model. These are the starting points of the chain of linkages that connect new market rate units to additional demand for affordable residential units.

This section presents a summary of the market rate prototypes and the estimated household income of purchasers or renters of the market rate units.

#### ***Recent Housing Market Activity and Prototypical Units***

KMA worked with City staff to select four representative development prototypes envisioned to be developed in Hayward in the future based on projects proposed and recently built in the City. KMA then undertook a market survey of residential projects to estimate current sale prices and rent levels. More details on the market survey can be found in Appendix A.

At the time of the market survey in mid-July 2017, there were 12 new for-sale residential developments being marketed in Hayward. Asking prices for these units, combined with recent closed home sales in the market, formed the basis for the pricing in the nexus analysis. For market rents for new apartment developments in Hayward, KMA performed a survey of asking apartment rents in select properties in Hayward and neighboring jurisdictions.

The four residential prototypes are summarized in the table below. The main objective of the survey was to review current market sales prices or rents, per unit and per square foot, for the various residential project types in Hayward.

It is important to note that the residential prototypes analysis is intended to reflect average or typical residential projects in the local market rather than any specific project. It would be expected that the characteristics and pricing of specific projects would vary to some degree from the residential prototypes analyzed. In summary, the residential prototypes analyzed in the nexus analysis are as follows:

<b>Hayward Residential Prototypes</b>				
	<i>Typical Density</i>	<i>Average Unit Size</i>	<i>Average Price/Rent</i>	<i>Price/Rent \$/SF</i>
<b>For-Sale Prototypes</b>				
1) Single Family Detached	10 du/acre	2,500 sq. ft.	\$950,000	\$380/SF
2) Townhomes/Attached	20 du/acre	2,000 sq. ft.	\$800,000	\$400/SF
3) Condominiums (Stacked Flats)	50 du/acre	1,000 sq. ft.	\$590,000	\$590/SF
<b>Rental Prototype</b>				
4) Apartments	60 du/acre	900 sq. ft.	\$2,800	\$3.11/SF

Source: KMA market study; see Appendix A.

### ***Income of Housing Unit Purchaser or Renter***

After the prototypes are established, the next step in the analysis is to determine the income of the purchasing or renting households in the prototypical units.

#### *Ownership Units*

To make the determination for ownership units, terms for the purchase of residential units used in the analysis are slightly less favorable than what can be achieved at the current time since current terms are not likely to endure. The selected terms for the analysis are: a down-payment of 20% which is representative of new purchase loans originated locally.<sup>2</sup> A 30-year fixed rate loan at a 5% interest is assumed. The interest rate at 5% reflects a longer term average rate based on data for the last fifteen years from June 2002 to June 2017.<sup>3</sup> An interest rate premium of 0.25% is added to non-conforming loans over \$636,150 (jumbo loans). Tables A-1 to A-3 at the end of this section provide the details.

All ownership product types include an estimate of homeowners' insurance, homeowner association dues, and property taxes. These are included along with the mortgage payment as part of housing expenses for purposes of determining mortgage eligibility.<sup>4</sup> The analysis estimates gross household income based on the assumption that these housing costs represent, on average, approximately 35% of gross income. The assumption that housing expenses represent

<sup>2</sup> Reflects the median down payment for new purchase loans originated in zip codes corresponding to Alameda and Santa Clara Counties derived from Freddie Mac dataset for loans issued in the 1st Quarter of 2015.

<sup>3</sup> Based on Freddie Mac Primary Mortgage Market Survey. Reflects weekly average rates for 30 year fixed rate mortgages during the period from 6/2002 through 6/2017 applicable to the West Region and rounded to the nearest whole percentage.

<sup>4</sup> Housing expenses are combined with other debt payments such as credit cards and auto loans to compute a Debt To Income (DTI) ratio which is a key criteria used for determining mortgage eligibility.

35% of gross income is reflective of the local average for new purchase loans<sup>5</sup> and is consistent with criteria used by lenders to determine mortgage eligibility.<sup>6</sup>

### *Apartment Units*

Household income for renter households is estimated based on the assumption that housing costs, including rent and utilities, represents on average 30% of gross household income. The 30% factor was selected for consistency with the California Health and Safety Code standard for relating income to affordable rent levels.<sup>7</sup> The resulting relationship is that annual household income is 3.3 times annual rent.

The estimated gross household incomes of the purchasers or renters of the prototype units are calculated in Tables A-1 through A-4 and summarized below.

<b>Gross Household Income</b>				
	<i>Single Family</i>			
	<i>Detached</i>	<i>Townhome</i>	<i>Condominium</i>	<i>Apartments</i>
Gross Household Income	\$187,000	\$162,000	\$121,000	\$117,000

### ***Income Available for Expenditures***

The input into the IMPLAN model used in this analysis is the net income available for expenditures. To arrive at income available for expenditures, gross income must be adjusted for Federal and State income taxes, contributions to Social Security and Medicare, savings, and payments on household debt. Per KMA correspondence with the producers of the IMPLAN model (IMPLAN Group LLC), other taxes including sales tax, gas tax, and property tax are handled internally within the model as part of the analysis of expenditures. Payroll deduction for medical benefits and pre-tax medical expenditures are also handled internally within the model. Housing costs are addressed separately, as described below, and so are not deducted as part of this adjustment step. Table A-5 at the end of this section shows the calculation of income available for expenditures.

<sup>5</sup> Freddie Mac data on new purchase loans originated in zip codes corresponding to Santa Clara and Alameda Counties for the 1st Quarter of 2015 indicates an average debt to income ratio of 37%; however, most households have other forms of debt such as credit cards, student loans, and auto loans that are included as part of this ratio and the ratio considering housing costs only would be lower. Application of a 35% ratio is also consistent with the California Health and Safety Code standard for relating income to housing costs for ownership units.

<sup>6</sup> Fannie Mae mortgage underwriting eligibility criteria establishes a debt to income threshold of 36% above which tighter credit standards apply. A debt to income ratio of up to 45% is permitted for borrowers meeting specified credit criteria; however, most households have other forms of debt such as credit cards, student loans, and auto loans that would be considered as part of this ratio.

<sup>7</sup> Health and Safety Code Section 50052.5 defines affordable rent levels based on 30% of income.

Income available for expenditures is estimated at approximately 67% to 68% of gross income, depending on the market rate prototype. The estimates are based on a review of data from the Internal Revenue Service and California Franchise Tax Board tax tables. Per the Internal Revenue Service, households earning between \$100,000 and \$200,000 per year who itemize deductions on their tax returns will pay an average of 12.2% of gross income for federal taxes. Residents of the market rate rental units are estimated to pay an average of 14.0% of gross income in federal income taxes, the average for households in the \$100,000 to \$200,000 income range not itemizing deductions on their taxes. State taxes are estimated to range from 3.7% to 4.7% of gross income, based on tax rates per the California Franchise Tax Board. The employee share of FICA payroll taxes for Social Security and Medicare is 7.65% of gross income. A ceiling of \$127,200 per employee applies to the 6.2% Social Security portion of this tax rate.

Savings and repayment of household debt represent another necessary adjustment to gross income. Savings includes various IRA and 401 K type programs as well as non-retirement household savings and investments. Debt repayment includes auto loans, credit cards, and all other non-mortgage debt. Savings and repayment of debt are estimated to represent a combined 8% of gross income based on a 20-year average derived from United States Bureau of Economic Analysis data.

The percentage of income available for expenditure for input into the IMPLAN model is prior to deducting housing costs. The reason is for consistency with the IMPLAN model, which defines housing costs as expenditures. The IMPLAN model addresses the fact that expenditures on housing do not generate employment to the degree other expenditures such as retail or restaurants do, but there is some limited maintenance and property management employment generated.

After deducting income taxes, Social Security, Medicare, savings, and repayment of debt, for purchasers of one of the new ownership prototypes, the estimated income available for expenditures is 67% - 68%. These are the factors used to adjust from gross income to the income available for expenditures for input into the IMPLAN model. As indicated above, other forms of taxation such as property tax are handled internally within the IMPLAN model.

Another adjustment made to spending is to account for standard operational vacancy in rental units of 5%, a level of vacancy considered average for rental units in a healthy market. A comparable adjustment is not applied to the ownership units as newly built ownership units are anticipated to have only a nominal level of vacancy.

Estimates of household income available for expenditures are presented below:

## Income Available for Expenditures

	<i>Single Family</i>			
	<i>Detached</i>	<i>Townhome</i>	<i>Condominium</i>	<i>Apartments</i>
Gross Household Income	\$187,000	\$162,000	\$121,000	\$117,000
Percent Income available for Expenditures	67%	68%	68%	67%
Spending Adjustment / Rental Vacancy	N/A	N/A	N/A	95%
Household Income Available for Expenditure <sup>(1)</sup>				
One Unit	\$125,300	\$110,200	\$82,300	\$74,000
100 Units [input to IMPLAN]	\$12,530,000	\$11,020,000	\$8,230,000	\$7,400,000

(1) Calculated as gross household income multiplied by the percent available for expenditures multiplied by the spending adjustment for rental vacancy. Result includes the share of income spent on housing as the required input to the IMPLAN model is income after taxes but before deduction of housing costs as described above.

The nexus analysis is conducted on 100-unit building modules for ease of presentation, and to avoid awkward fractions. The spending associated with 100 market rate residential units is the input into the IMPLAN model. Tables A-6 and A-7 summarize the conclusions of this section and calculate the household income for the 100-unit building modules.

<b>Annual Household Income Required</b>			<b>\$187,000</b>
<b>Sales Price to Income Ratio</b>			<b>5.1</b>

Notes

(1) Based on KMA Market Survey.

(2) Reflects the median down payment for new purchase loans originated in zip codes corresponding to Alameda and Santa Clara Counties derived from Freddie Mac dataset for loans issued in the 1st Quarter of 2015.

(3) Average mortgage interest rate for prior 15 years derived from Freddie Mac Primary Mortgage Market Survey, West Region (rounded to nearest whole percentage). Based on weekly average rates for 30 year fixed rate mortgages during the period from 6/2002 through 6/2017. Includes a 0.25% premium to reflect the non-conforming nature of the loan (jumbo loan).

(4) Property tax rate is inclusive of ad valorem taxes and applicable voter approved rates, fixed charges, and assessments for the jurisdiction indicated. Source: ListSource.

(5) Estimated from quotes obtained from Progressive Insurance.

(6) Ratio is consistent with Fannie Mae mortgage underwriting eligibility criteria which establishes a debt to income threshold of 36% above which tighter credit standards apply. A debt to income ratio of up to 45% is permitted for borrowers meeting specified credit criteria. Ratio is also consistent with the California Health and Safety Code standard for relating income to housing costs for ownership units. Freddie Mac data on new purchase loans originated in zip codes corresponding to Santa Clara and Alameda Counties for the 1st Quarter of 2015 indicates an average debt to income ratio of 37%; however, most households have other forms of debt such as credit cards, student loans, and auto loans that are included as part of this ratio and the ratio considering housing costs only would be lower.

Notes

(1) Based on KMA Market Survey.

(2) Reflects the median down payment for new purchase loans originated in zip codes corresponding to Alameda and Santa Clara Counties derived from Freddie Mac dataset for loans issued in the 1st Quarter of 2015.

(3) Average mortgage interest rate for prior 15 years derived from Freddie Mac Primary Mortgage Market Survey, West Region (rounded to nearest whole percentage). Based on weekly average rates for 30 year fixed rate mortgages during the period from 6/2002 through 6/2017. Includes a 0.25% premium to reflect the non-conforming nature of the loan (jumbo loan).

(4) Property tax rate is inclusive of ad valorem taxes and applicable voter approved rates, fixed charges, and assessments for the jurisdiction indicated. Source: ListSource.

(5) Estimated from quotes obtained from Progressive Insurance.

(6) Ratio is consistent with Fannie Mae mortgage underwriting eligibility criteria which establishes a debt to income threshold of 36% above which tighter credit standards apply. A debt to income ratio of up to 45% is permitted for borrowers meeting specified credit criteria. Ratio is also consistent with the California Health and Safety Code standard for relating income to housing costs for ownership units. Freddie Mac data on new purchase loans originated in zip codes corresponding to Santa Clara and Alameda Counties for the 1st Quarter of 2015 indicates an average debt to income ratio of 37%; however, most households have other forms of debt such as credit cards, student loans, and auto loans that are included as part of this ratio and the ratio considering housing costs only would be lower.

<u>Less:</u>				
Federal Income Taxes <sup>2</sup>	12.2%	12.2%	12.2%	14.0%
State Income Taxes <sup>3</sup>	4.7%	4.4%	3.7%	3.8%
FICA Tax Rate <sup>4</sup>	7.65%	7.65%	7.65%	7.65%
Savings & other deductions <sup>5</sup>	8%	8%	8%	8%
<b>Percent of Income Available for Expenditures<sup>6</sup> [Input to IMPLAN model]</b>	<b>67%</b>	<b>68%</b>	<b>68%</b>	<b>67%</b>

Notes:

- <sup>1</sup> Gross income after deduction of taxes and savings. Income available for expenditures is the input to the IMPLAN model which is used to estimate the resulting employment impacts. Housing costs are not deducted as part of this adjustment step because they are addressed separately as expenditures within the IMPLAN model.
- <sup>2</sup> Reflects average tax rates (as opposed to marginal) based on U.S. Internal Revenue Services, Tax Statistics, Tables 1.1 and 2.1 for 2014. Homeowners are assumed to itemize deductions. Renter households are assumed to take the standard deduction. Tax rates reflect averages for applicable income range.
- <sup>3</sup> Average tax rate estimated by KMA based on marginal rates per the California Franchise Tax Board and ratios of taxable income to gross income estimated based on U.S. Internal Revenue Service data.
- <sup>4</sup> For Social Security and Medicare. Social Security taxes estimated based upon the current ceiling on applicability of Social Security taxes of \$127,200 (ceiling applies per earner not per household) and the average number of earners per household.
- <sup>5</sup> Household savings including retirement accounts like 401k / IRA and other deductions such as interest costs on credit cards, auto loans, etc, necessary to determine the amount of income available for expenditures. The 8% rate used in the analysis is based on the average over the past 20 years computed from U.S. Bureau of Economic Analysis data, specifically the National Income and Product Accounts, Table 2.1 "Personal Income and Its Disposition."
- <sup>6</sup> Deductions from gross income to arrive at the income available for expenditures are consistent with the way the IMPLAN model and National Income and Product Accounts (NIPA) defines income available for personal consumption expenditures. Income taxes, contributions to Social Security and Medicare, and savings are deducted; however, property taxes and sales taxes are not. Housing costs are not deducted as part of the adjustment because they are addressed separately as expenditures within the IMPLAN model.

## **B. The IMPLAN Model**

Consumer spending by residents of new housing units will create jobs, particularly in sectors such as restaurants, health care, and retail, which are closely connected to the expenditures of residents. The widely used economic analysis tool, IMPLAN (IMpact Analysis for PLANning), was used to quantify these new jobs by industry sector.

### **IMPLAN Model Description**

The IMPLAN model is an economic analysis software package now commercially available through the IMPLAN Group, LLC. IMPLAN was originally developed by the U.S. Forest Service, the Federal Emergency Management Agency, and the U.S. Department of the Interior Bureau of Land Management and has been in use since 1979 and refined over time. It has become a widely used tool for analyzing economic impacts for a broad range of applications from major construction projects to natural resource programs.

IMPLAN is based on an input-output accounting of commodity flows within an economy from producers to intermediate and final consumers. The model establishes a matrix of supply chain relationships between industries and also between households and the producers of household goods and services. Assumptions about the portion of inputs or supplies for a given industry likely to be met by local suppliers, and the portion supplied from outside the region or study area are derived internally within the model using data on the industrial structure of the region.

The output or result of the model is generated by tracking changes in purchases for final use (final demand) as they filter through the supply chain. Industries that produce goods and services for final demand or consumption must purchase inputs from other producers, which in turn, purchase goods and services. The model tracks these relationships through the economy to the point where leakages from the region stop the cycle. This allows the user to identify how a change in demand for one industry will affect a list of over 500 other industry sectors. The projected response of an economy to a change in final demand can be viewed in terms of economic output, employment, or income.

Data sets are available for each county and state, so the model can be tailored to the specific economic conditions of the region being analyzed. This analysis utilizes the data set for Alameda County. As will be discussed, much of the employment impact is in local-serving sectors, such as retail, eating and drinking establishments, and medical services. A significant portion of these jobs will be located in Hayward or nearby. In addition, the employment impacts will extend throughout the county and beyond based on where jobs are located that serve Hayward residents. In fact, Hayward is part of the larger Bay Area economy and impacts will likewise extend throughout the region. However, consistent with the conservative approach taken in the nexus analysis, only the impacts that occur within Alameda County are included in the analysis.

## Application of the IMPLAN Model to Estimate Job Growth

The IMPLAN model was applied to link income to household expenditures to job growth. Employment generated by the household income of residents is analyzed in modules of 100 residential units to simplify communication of the results and avoid awkward fractions. The IMPLAN model distributes spending among various types of goods and services (industry sectors) based on data from the Consumer Expenditure Survey and the Bureau of Economic Analysis Benchmark input-output study, to estimate employment generated.

Job creation, driven by increased demand for products and services, was projected for each of the industries that will serve the new households. The employment generated by this new household spending is summarized below.

<b>Jobs Generated Per 100 Units</b>				
	<i>Single Family</i>			
	<i>Detached</i>	<i>Townhome</i>	<i>Condominium</i>	<i>Apartments</i>
Annual Household Expenditures (100 Units)	\$12,530,000	\$11,020,000	\$8,230,000	\$7,400,000
Total Jobs Generated (100 Units)	93.0	81.8	58.2	52.3

Table B-1 provides a detailed summary of employment generated by industry. The table shows industries sorted by projected employment. The Consumer Expenditure Survey published by the Bureau of Labor Statistics tracks expenditure patterns by income level. IMPLAN utilizes this data to reflect the pattern by income bracket. Estimated employment is shown for each IMPLAN industry sector representing 1% or more of total employment. The jobs that are generated are heavily retail jobs, jobs in restaurants and other eating establishments, and in services that are provided locally such as health care. The jobs counted in the IMPLAN model cover all jobs, full and part time, similar to the U.S. Census and all reporting agencies (unless otherwise indicated).

<b>Total Number of Jobs Generated</b>	<b>93.0</b>	<b>81.8</b>	<b>58.2</b>	<b>52.3</b>	<b>100%</b>

<sup>1</sup> Estimated employment generated by expenditures of households within 100 prototypical market rate units for Industries representing more than 1% of total employment. Employment estimates are based on the IMPLAN Group's economic model, IMPLAN. Includes both full- and part-time jobs.

### C. The KMA Jobs Housing Nexus Model

This section presents a summary of the analysis linking the employment growth associated with residential development, or the output of the IMPLAN model (see Section B), to the estimated number of lower income housing units required in each of four income categories, for each of the four residential prototype units.

#### Analysis Approach and Framework

The analysis approach is to examine the employment growth for industries related to consumer spending by residents in the 100-unit modules. Then, through a series of linkage steps, the number of employees is converted to households and housing units by affordability level. The findings are expressed in terms of numbers of affordable units per 100 market rate units. The analysis addresses the affordable unit demand associated with single family detached, townhomes, condos, and rental units.

The table below shows the 2017 Area Median Income (AMI) for Alameda County, as well as the income limits for the four categories that were evaluated: Extremely Low (30% of AMI), Very Low (50% of AMI), Low (80% of AMI), and Moderate (120% of AMI). The income definitions used in the analysis are those published by the California Department of Housing and Community Development (HCD).

2017 Income Limits for Alameda County	Household Size (Persons)					
	1	2	3	4	5	6 +
Extr. Low (Under 30% AMI)	\$21,950	\$25,050	\$28,200	\$31,300	\$33,850	\$36,350
Very Low (30%-50% AMI)	\$36,550	\$41,750	\$46,950	\$52,150	\$56,350	\$60,500
Low (50%-80% AMI)	\$56,300	\$64,350	\$72,400	\$80,400	\$86,850	\$93,300
Moderate (80%-120% AMI)	\$81,850	\$93,500	\$105,200	\$116,900	\$126,250	\$135,600
Median (100% of Median)	\$68,200	\$77,900	\$87,650	\$97,400	\$105,200	\$113,000

Source: California Department of Housing and Community Development.

The analysis is conducted using a model that KMA developed and has applied to similar evaluations in many other jurisdictions. The model inputs are all local data to the extent possible, and are fully documented in the following description.

#### Analysis Steps

The tables at the end of this section present a summary of the nexus analysis steps for the prototype units. Following is a description of each step of the analysis.

### **Step 1 – Estimate of Total New Employees**

Table C-1 commences with the total number of employees associated with the new market rate units. The employees were estimated based on household expenditures of new residents using the IMPLAN model (see Section B).

### **Step 2 – Changing Industries Adjustment and Net New Jobs**

The local economy, like that of the U.S. as a whole, is constantly evolving, with job losses in some sectors and job growth in others. Over the past decade, employment in manufacturing sectors of the local economy have declined along with governmental employment, farming, construction and financial activities employment. Jobs lost over the last decade in these declining sectors were replaced by job growth in other industry sectors.

Step 2 makes an adjustment to take ongoing changes in the economy into account recognizing that jobs added are not 100% net new in all cases. A 20% adjustment is utilized based on the long term shifts in employment that have occurred in some sectors of the local economy and the likelihood of continuing changes in the future. Long term declines in employment experienced in some sectors of the economy mean that some of the new jobs are being filled by workers that have been displaced from another industry and who are presumed to already have housing locally. Existing workers downsized from declining industries are assumed to be available to fill a portion of the new retail, restaurant, health care, and other jobs associated with services to residents.

The 20% downward adjustment used for purposes of the analysis was derived from California Employment Development Department data on employment by industry in the Oakland-Hayward-Berkeley and San Jose-Sunnyvale-Santa Clara Metropolitan Districts over the ten-year period from 2005 to 2015 and reflects the ratio between jobs lost in declining industries to jobs gained in growing and stable industries at 20%<sup>8</sup>. The 20% factor is applied as an adjustment in the analysis, effectively assuming one in every five new jobs is filled by a worker down-sized from a declining industry and who already lives locally.

The discount for changing industries is a conservative analysis assumption that may result in an understatement of impacts. The adjustment assumes workers down-sized from declining sectors of the local economy are available to fill a portion of the new service sector jobs documented in a residential nexus analysis. In reality, displaced workers from declining industry sectors of the economy are not always available to fill these new service jobs because they may retire or exit the workforce or may be competitive for and seek employment in one of the other growing sectors of the local economy that is not oriented towards services to local residents.

---

<sup>8</sup> The 20% ratio is calculated as 55,000 jobs lost in declining sectors excluding defense divided by 268,000 jobs gained in growing and stable sectors = 20.5% (rounded to 20%).

### ***Step 3 – Adjustment from Employees to Employee Households***

This step (Table C-1) converts the number of employees to the number of employee households, recognizing that there is, on average, more than one worker per household, and thus the number of housing units in demand for new workers is reduced. The workers-per-worker-household ratio eliminates from the equation all non-working households, such as retired persons, students, and those on public assistance. The County average of 1.62 workers per worker household (from the U. S. Census Bureau 2011-2015 American Community Survey) is used for this step in the analysis. The number of jobs is divided by 1.62 to determine the number of worker households. This ratio is distinguished from the overall number of workers per household in that the denominator includes only households with at least one worker. If the average number of workers in all households were used, it would have produced a greater demand for housing units. The 1.62 ratio covers all workers, full and part time.

### ***Step 4 – Occupational Distribution of Employees***

The occupational breakdown of employees is the first step to arrive at income level. The output from the IMPLAN model provides the number of employees by industry sector, shown in Table B-1. The IMPLAN output is paired with data from the Department of Labor, Bureau of Labor Statistics May 2016 Occupational Employment Survey (OES) to estimate the occupational composition of employees for each industry sector.

#### ***Step 4a – Translation from IMPLAN Industry Codes to NAICS Industry Codes***

The output of the IMPLAN model is jobs by industry sector using IMPLAN's own industry classification system, which consists of 536 industry sectors. The OES occupation data uses the North American Industry Classification System (NAICS). Estimates of jobs by IMPLAN sector must be translated into estimates by NAICS code for consistency with the OES data.

The NAICS system is organized into industry codes ranging from two- to six-digits. Two-digit codes are the broadest industry categories and six-digit codes are the most specific. Within a two-digit NAICS code, there may be several three-digit codes and within each three-digit code, several four-digit codes, etc. A chart published by IMPLAN relates each IMPLAN industry sector with one or more NAICS codes, with matching NAICS codes ranging from the two-digit level to the five-digit level. For purposes of the nexus analysis, all employment estimates must be aggregated to the four, or in some cases, five-digit NAICS code level to align with OES data which is organized by four and five-digit NAICS code. For some industry sectors, an allocation is necessary between more than one NAICS code. Where required, allocations are made proportionate to total employment at the national level from the OES.

The table below illustrates analysis Step 4a in which employment estimates by IMPLAN Code are translated to NAICS codes and then aggregated at the four and five digit NAICS code level.

The examples used are Child Day Care Centers and Hospitals. The process is applied to all the industry sectors.

<b>Illustration of Model Step 4a.</b>						
A. IMPLAN Output by IMPLAN Industry Sector		B. Link to Corresponding NAICS		C. Aggregate at 4-Digit NAICS Code Level		
<u>Jobs</u>	<u>IMPLAN Sector</u>	<u>Jobs</u>	<u>NAICS Code</u>	<u>Jobs</u>	<u>% Total</u>	<u>4-Digit NAICS</u>
1.6	487 - Child day care services	1.6	6244 Child day care services	1.6	100%	6244 Child day care services
3.0	482 - Hospitals	3.0	622 Hospitals	2.8	92%	6221 General Medical and Surgical Hospitals
				0.1	4%	6222 Psychiatric and Substance Abuse Hospitals
				0.1	4%	6223 Specialty (except Psychiatric and Substance Abuse) Hospitals

Source: KMA, Bureau of Labor Statistics May 2016 Occupational Employment Survey.

*Step 4b – Apply OES Data to Estimate Occupational Distribution*

Employment estimates by four and five-digit NAICS code from step 4a are paired with data on occupational composition within each industry from the OES to generate an estimate of employment by detailed occupational category. As shown on Table C-1, new jobs will be distributed across a variety of occupational categories. The three largest occupational categories are office and administrative support (16%), food preparation and serving (14%), and sales and related (13%). Step 4 of Table C-1 indicates the percentage and number of employee households by occupation associated with 100 market rate units.

**Step 5 – Estimates of Employee Households Meeting the Lower Income Definitions**

In this step, occupations are translated to employee incomes based on recent Alameda County wage and salary information from the California Employment Development Department (EDD). The wage and salary information summarized in Appendix B provided the income inputs to the model.

For each occupational category shown in Table C-1, the OES data provides a distribution of specific occupations within the category. For example, within the Food Preparation and Serving Category, there are Supervisors, Cooks, Bartenders, Waiters and Waitresses, Dishwashers, etc. In total there are over 100 detailed occupation categories included in the analysis as shown in the Appendix B tables. Each of these over 100 occupation categories has a different

distribution of wages which was obtained from EDD and is specific to workers in Alameda County as of 2017.

For each detailed occupational category, the model uses the distribution of wages to calculate the percent of worker households that would fall into each income category. The calculation is performed for each possible combination of household size and number of workers in the household. For households with more than one worker, individual *employee* income data was used to calculate the household income by assuming multiple earner households are, on average, formed of individuals with similar incomes.

At the end of Step 5, the nexus model has established a matrix indicating the percentages of households that would qualify in the affordable income tiers for every detailed occupational category and every potential combination of household size and number of workers in the household.

### ***Step 6 – Distribution of Household Size and Number of Workers***

In this step, we account for the distribution in household sizes and number of workers for Alameda County households using local data obtained from the U.S. Census. Census data is used to develop a set of percentage factors representing the distribution of household sizes and number of workers within working households. The percentage factors are specific to Alameda County and are derived from the 2011 – 2015 American Community Survey. Application of these percentage factors accounts for the following:

- Households have a range in size and a range in the number of workers.
- Large households generally have more workers than smaller households.

The result of Step 6 is a distribution of Alameda County working households by number of workers and household size.

### ***Step 7 – Estimate of Number of Households that Meet Size and Income Criteria***

Step 7 is the final step to calculate the number of worker households meeting the size and income criteria for the four affordability tiers. The calculation combines the matrix of results from Step 5 on percentage of worker households that would meet the income criteria at each potential household size / number of workers combination, with Step 6, the percentage of worker household having a given household size / number of workers combination. The result is the percent of households that fall into each affordability tier. The percentages are then multiplied by the number of households from Step 3 to arrive at number of households in each affordability tier.

Table C-2A shows the result after completing Steps 5, 6, and 7 for the Extremely Low Income Tier. Tables C-2B, C-2C, C-2D show results for the Very Low, Low, and Moderate Income tiers.

## Summary Findings

Table C-3 indicates the results of the analysis for all the affordability tiers. The table presents the number of households generated in each affordability category and the total number over 120% of Area Median Income.

The findings in Table C-3 are presented below. The table shows the total demand for affordable housing units associated with 100 market rate units.

<b><i>New Worker Households per 100 Market Rate Units</i></b>				
	<i>Single Family</i>			
	<i>Detached</i>	<i>Townhome</i>	<i>Condominium</i>	<i>Apartments</i>
Extremely Low (0%-30% AMI)	5.1	4.5	3.2	2.9
Very Low (30%-50% AMI)	11.8	10.4	7.4	6.6
Low (50%-80% AMI)	12.2	10.8	7.6	6.8
Moderate (80%-120% AMI)	7.4	6.5	4.6	4.1
<b>Total, Less than 120% AMI</b>	<b>36.6</b>	<b>32.2</b>	<b>22.8</b>	<b>20.5</b>
Greater than 120% AMI	9.3	8.2	5.9	5.3
<b>Total, New Households</b>	<b>45.9</b>	<b>40.3</b>	<b>28.7</b>	<b>25.8</b>

Housing demand for new worker households earning less than 120% of AMI ranges from 36.6 units per 100 market rate units for single family detached units to 20.5 per 100 market rate units for the apartments. Housing demand is distributed across the lower income tiers with the greatest numbers of households in the Very Low and Low tiers. The finding that the jobs associated with consumer spending tend to be low-paying jobs where the workers will require housing affordable at the lower income levels is not surprising. As noted above, direct consumer spending results in employment that is concentrated in lower paid occupations including food preparation, administrative, and retail sales.

**Notes:**

- <sup>1</sup> Estimated employment generated by expenditures of households within 100 prototypical market rate units from Table B-1.
- <sup>2</sup> The 20% adjustment is based upon job losses in declining sectors of the local economy over the past 10 years. "Downsized" workers from declining sectors are assumed to fill a portion of new jobs in sectors serving residents. 20% adjustment calculated as 54,700 jobs lost in declining sectors divided by 267,700 jobs gained in growing and stable sectors = 20%.
- <sup>3</sup> Adjustment from number of workers to households using county-wide average of 1.62 workers per worker household derived from the U.S. Census American Community Survey 2011 to 2015.
- <sup>4</sup> See Appendix B Tables 1 - 4 for additional information on Major Occupation Categories.

Notes

<sup>1</sup> Households of retail, education, healthcare and other workers that serve residents of new market rate units.

AMI = Area Median Income

## **D. Mitigation Costs**

This section takes the conclusions of the previous section on the number of households in the lower income categories associated with the market rate units and identifies the total cost of assistance required to make housing affordable. This section puts a cost on the units for each income level to produce the “total nexus cost.” This is done for each of the prototype units.

A key component of the analysis is the size of the gap between what households can afford and the cost of producing new housing in Hayward, known as the ‘affordability gap.’ Affordability gaps are calculated for each of the four categories of Area Median Income: Extremely Low (under 30% of median), Very Low (30% to 50%), Low (50% to 80%), and Moderate (80% to 120%). The following summarizes the analysis of mitigation cost which is based on the affordability gap or net cost to deliver units that are affordable to worker households in the lower income tiers.

### **City Assisted Affordable Unit Prototypes**

For estimating the affordability gap, there is a need to match a household of each income level with a unit type and size according to governmental regulations and City practices and policies. The analysis assumes that the City will assist Moderate Income households earning between 80% and 120% of Area Median Income with ownership units. The prototype affordable unit should reflect a modest unit consistent with what the City is likely to assist and appropriate for housing the average Moderate Income worker household. The typical project assumed for Hayward is a three-bedroom attached townhome unit for a four-person household.

For Low-, Very Low-, and Extremely Low-Income households, it is assumed that the City will assist in the development of multi-family rental units. The analysis uses a two-bedroom affordable rental unit for a three-person household.

### **Development Costs**

KMA prepared an estimate of the total development cost for the two affordable housing prototypes described above (inclusive of land acquisition costs, direct construction costs, indirect costs of development, and financing) based on a review of development pro formas for recent affordable projects, recent residential land sale comps, and other construction data sources such as RS Means. It is estimated that the new affordable for-sale townhome unit would have a total development cost of approximately \$564,000 and the new affordable multi-family apartment unit would have a total development cost of approximately \$502,000. Development cost assumptions were designed to be reflective of averages for affordable projects in Hayward. Tables D-1 and D-3 provide further details.

<b>Development Costs for Affordable Units</b>		
<i>Income Group</i>	<i>Unit Tenure / Type</i>	<i>Development Cost</i>
Under 30% AMI	Rental	\$502,000
30% to 50% AMI	Rental	\$502,000
50% to 80% AMI	Rental	\$502,000
80% to 120% AMI	Ownership	\$564,000

The multi-family construction costs reflect the costs of building at higher densities, including structured parking garages as well as the inclusion of common building areas such as internal hallways, lobbies, community rooms, and a manager’s office, which townhome developments typically do not have. Prevailing wages are assumed in the construction of both affordable housing prototypes, as it is assumed that public funds will be used to subsidize the projects.

Development cost estimates were informed by KMA’s review of pro forma information for three recent affordable projects in Hayward as well as numerous other local multi-family affordable housing projects. Direct construction costs from these projects were adjusted to account for such factors as time, unit size, housing type, and project density to appropriately reflect the multi-family prototype assumed in the analysis. Other costs, such as land acquisition costs, are more site and area specific than direct construction costs and therefore the inputs for those costs were derived from other sources.

### **Unit Values**

For affordable ownership units, the unit value was based on an estimate of the restricted affordable purchase price for a qualifying Moderate Income household. For a 3-bedroom unit, KMA calculated the affordable sales price for the matching 4-person household at \$391,600. Details of the calculation are presented in Table D-3.

For the Extremely Low, Very Low, and Low-Income rental units, unit values are based upon the funding sources assumed to be available for the project. The funding sources include permanent debt financing supported by the project’s operating income, a deferred developer fee, and equity generated by the sale of Low Income Housing Tax Credits (LIHTC), a common source of financing for affordable apartment projects. Affordable housing subsidies from other sources such as CDBG, HOME, AHP, Section 8, and various Federal and State funding programs are limited and difficult to obtain and therefore are not assumed in this analysis as available to offset the cost of mitigating the affordable housing impacts of new development.

On this basis, KMA estimated the unit value (total permanent funding sources) of the Extremely Low-Income rental units at \$223,800, the Very Low-Income units at \$295,800, and the Low-income units at \$331,800. Details for these calculations are presented in Table D-1.

Unit Values for Affordable Units			
Income Group	Unit Tenure / Type	Household Size	Unit Values / Affordable Sales Price
Under 30% AMI	Rental	3 persons	\$223,800
30% to 50% AMI	Rental	3 persons	\$295,800
50% to 80% AMI	Rental	3 persons	\$331,800
80% to 120% AMI	Ownership	4 persons	\$391,600

### Affordability Gap

The affordability gap is the difference between the cost of developing the affordable units and the unit value based on the restricted affordable rent or sales price.

The resulting affordability gaps are as follows:

Affordability Gap Calculation			
	Unit Value / Affordable Sales Price	Development Cost	Affordability Gap
<u>Affordable Rental Units</u>			
Extremely Low (Under 30% AMI)	\$223,800	\$502,000	\$278,200
Very Low (30% to 50% AMI)	\$295,800	\$502,000	\$206,200
Low (50% to 80% AMI)	\$331,800	\$502,000	\$170,200
<u>Affordable Ownership Units</u>			
Moderate (80% to 120% AMI)	\$391,600	\$564,000	\$172,400

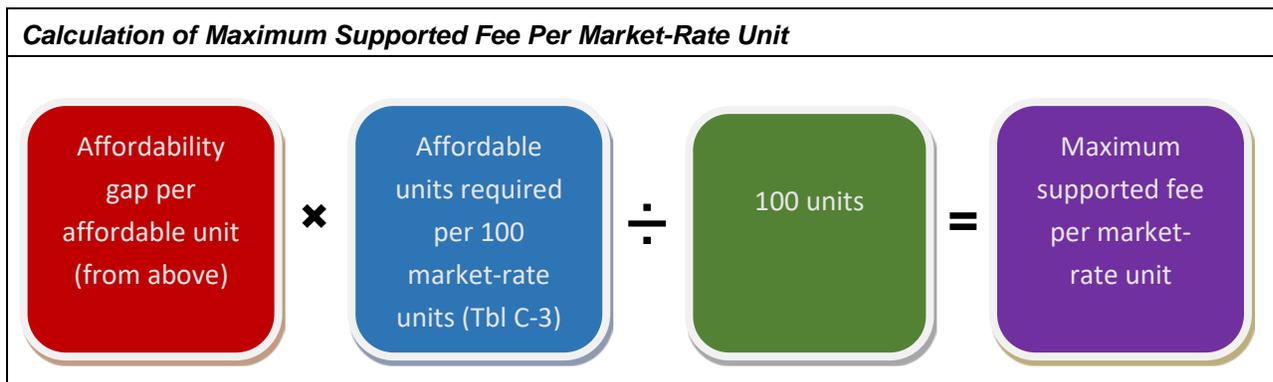

AMI = Area Median Income

Tables D-1 through D-3 present the detailed affordability gap calculations.

### Total Nexus Cost / Maximum Fee Levels

The last step in the linkage fee analysis marries the findings on the numbers of households in each of the lower income ranges associated with the four prototypes to the affordability gaps, or the costs of delivering housing to them in Hayward.

Table D-4 summarizes the analysis. The Affordability Gaps are drawn from the prior discussion. The “Total Nexus Cost per Market Rate Unit” shows the results of the following calculation:

The total nexus costs or maximum supported fee per market rate unit for each of the prototypes are as follows:

<b>Total Nexus Cost Per Market Rate Unit, City of Hayward</b>				
<i>Income Category</i>	<i>Single Family Detached</i>	<i>Townhome</i>	<i>Condominium</i>	<i>Apartments</i>
Extremely Low (0%-30% AMI)	\$14,200	\$12,400	\$8,900	\$8,000
Very Low (30%-50% AMI)	\$24,400	\$21,500	\$15,200	\$13,700
Low (50%-80% AMI)	\$20,800	\$18,300	\$12,900	\$11,600
Moderate (80%-120% AMI)	\$12,800	\$11,200	\$7,900	\$7,100
<b>Total Supported Fee/ Nexus Costs</b>	<b>\$72,200</b>	<b>\$63,400</b>	<b>\$44,900</b>	<b>\$40,400</b>

The Total Nexus Costs, or Mitigation Costs, indicated above, may also be expressed on a per square foot level. The square foot area of the prototype unit used throughout the analysis becomes the basis for the calculation (the per unit findings from above are divided by unit size to get the per square foot findings). The results per square foot of building area (based on net rentable or sellable square feet excluding parking areas, external corridors and other common areas) are as follows:

<b>Total Nexus Cost Per Sq. Ft., City of Hayward</b>				
	<i>Single Family Detached</i>	<i>Townhome</i>	<i>Condominium</i>	<i>Apartments</i>
<i>Unit Size (Sq Ft)</i>	<i>2,500 SF</i>	<i>2,000 SF</i>	<i>1,000 SF</i>	<i>900 SF</i>
Extremely Low (0%-30% AMI)	\$5.70	\$6.20	\$8.90	\$8.90
Very Low (30%-50% AMI)	\$9.80	\$10.80	\$15.20	\$15.20
Low (50%-80% AMI)	\$8.30	\$9.20	\$12.90	\$12.90
Moderate (80%-120% AMI)	\$5.10	\$5.60	\$7.90	\$7.90
<b>Total Nexus Costs</b>	<b>\$28.90</b>	<b>\$31.80</b>	<b>\$44.90</b>	<b>\$44.90</b>

These costs express the total linkage or nexus costs for the four prototype developments in the City of Hayward. These total nexus costs represent the ceiling for any requirement placed on market rate development. **The totals are not recommended levels for fees; they represent only the maximums established by the analysis, below which fees may be set.**

**TABLE D-1  
AFFORDABILITY GAPS FOR EXTREMELY LOW, VERY LOW, AND LOW INCOME  
CITY OF HAYWARD**

	Extremely Low	Very Low	Low Income
<b>I. Affordable Prototype</b>			
Tenure	Rental

50% to 80% AMI	1,000 SF	\$8.30	\$9.20	\$12.90	\$12.90
80% to 120% AMI	900 SF	\$5.10	\$5.60	\$7.90	\$7.90
<b>Total Supported Fee Per Sq.Ft.</b>		<b>\$28.90</b>	<b>\$31.80</b>	<b>\$44.90</b>	<b>\$44.90</b>

Notes:

<sup>1</sup> Assumes affordable rental units. Affordability gaps represent the remaining affordability gap after tax credit financing. See affordability gap section for details.

<sup>2</sup> Affordability gap for moderate income households based on ownership unit.

<sup>3</sup> Nexus cost per unit calculated by multiplying the affordable unit demand per market rate units from Table C-3 by the affordability gap.

<sup>4</sup> Nexus cost per square foot computed by dividing the nexus cost per unit from above by the average unit size.

### **III. ADDENDUM: ADDITIONAL BACKGROUND AND NOTES ON SPECIFIC ASSUMPTIONS**

#### **No Excess Supply of Affordable Housing**

An assumption of this residential nexus analysis is that there is no excess supply of affordable housing available to absorb or offset new demand; therefore, new affordable units are needed to mitigate the new affordable housing demand generated by development of new market rate residential units. Based on a review of the current Census information for Hayward, conditions are consistent with this underlying assumption. According to the Census (2011 to 2015 ACS), approximately 48% of all households in the City were paying thirty percent or more of their income on housing. In addition, housing vacancy is minimal.

#### **Geographic Area of Impact**

The analysis quantifies impacts occurring within Alameda County. While many of the impacts will occur within the City, some impacts will be experienced elsewhere in Alameda County and beyond. The IMPLAN model computes the jobs generated within the county and sorts out those that occur beyond the county boundaries. The KMA Jobs Housing Nexus Model analyzes the income structure of jobs and their worker households, without assumptions as to where the worker households live.

In summary, the nexus analysis quantifies all the job impacts occurring within the county and related worker households. Job impacts, like most types of impacts, occur irrespective of political boundaries. And like other types of impact analyses, such as traffic, impacts beyond city boundaries may be mitigated by the city.

For clarification, counting all impacts associated with new housing units does not result in double counting, even if all jurisdictions were to adopt similar programs. The impact of a new housing unit is only counted once, in the jurisdiction in which it occurs. Obviously, within a metropolitan region such as the Bay Area, there is much commuting among jurisdictions, and cities house each other's workers in a very complex web of relationships. The important point is that impacts of residential development are only counted once.

#### **Affordability Gap**

The use of the affordability gap for establishing a maximum fee supported from the nexus analysis is grounded in the concept that a jurisdiction will be responsible for delivering affordable units to mitigate impacts. The nexus analysis has established that units will be needed at one or more different affordability levels and the type of unit to be delivered depends on the income/affordability level. In Hayward, the City is anticipated to assist in the development of rental units for households with incomes up to 80% of AMI and ownership units for moderate income households with incomes from 80% to 120% of AMI.

The units assisted by the public sector for affordable households are usually small in square foot area (for the number of bedrooms) and modest in finishes and amenities. As a result, in some communities these units are similar in physical configuration to what the market is delivering at market rate; in other communities (particularly very high income communities), they may be smaller and more modest than what the market is delivering. Parking, for example, is usually the minimum permitted by the code. Where there is a wide range in land cost per acre or per unit, it may be assumed that affordable units are built on land parcels in the lower portion of the cost range. KMA tries to develop a total development cost summary that represents the lower half of the average range, but not so low as to be unrealistic.

### **Excess Capacity of Labor Force**

In the context of economic downturns such as the last recession, the question is sometimes raised as to whether there is excess capacity in the labor force to the extent that consumption impacts generated by new households will be in part, absorbed by existing jobs and workers, thus resulting in fewer net new jobs. In response, an impact analysis of this nature is a one-time impact requirement to address impacts generated over the life of the project. Recessions are temporary conditions; a healthy economy will return and the impacts will be experienced. The economic cycle also self-adjusts. Development of new residential units is likely to be reduced until conditions improve or there is confidence that improved conditions are imminent. When this occurs, the improved economic condition of the households in the local area will absorb the current underutilized capacity of existing workers, employed and unemployed. By the time new units become occupied, economic conditions will have likely improved.

### **The Burden of Paying for Affordable Housing**

Hayward's inclusionary housing program does not place all burden for the creation of affordable housing on new residential construction. The burden of affordable housing is also borne by many sectors of the economy and society. A most important source of funding for affordable housing development comes from the federal government in the form of tax credits (which result in reduced income tax payment by tax credit investors in exchange for equity funding). Additionally, there are other federal grant and loan programs administered by the Department of Housing and Urban Development and other federal agencies. The State of California also plays a major role with a number of special financing and funding programs. Much of the state money is funded by voter approved bond measures paid for by all Californians.

Local governments play a large role in affordable housing. In addition, private sector lenders play an important role, some voluntarily and others less so with the requirements of the Community Reinvestment Act. Then there is the non-profit sector, both sponsors and developers that build much of the affordable housing.

In summary, all levels of government and many private parties, for profit and non-profit contribute to supplying affordable housing. Residential developers are not being asked to bear the burden alone any more than they are assumed to be the only source of demand or cause for needing affordable housing in our communities. Based on past experience, affordable housing requirements placed on residential development will satisfy only a small percentage of the affordable housing needs in the City of Hayward.

**APPENDIX A: RESIDENTIAL MARKET SURVEY**

---

## I. INTRODUCTION

One of the underlying components of the Residential Nexus Study is the identification of residential building prototypes that are expected to be developed in Hayward both today and in the future, and what the market prices and rents for those prototypes will be. These market prices and rents are then used to estimate the incomes of the new households that will live in the new units and quantify the number and types of jobs created as a result of their demand for goods and services. In this Appendix A, KMA describes the residential building prototypes utilized for the analysis, summarizes the residential market data researched, and describes the market price point conclusions drawn therefrom.

## II. RESIDENTIAL PROTOTYPES

KMA worked with City staff to select representative development prototypes envisioned to be developed in Hayward in the future. The following summarizes the basic characteristics of these prototypes.

<b>Hayward Residential Prototypes</b>				
	<i>Typical Density</i>	<i>Average Unit Size</i>	<i>Average Price/Rent</i>	<i>Price/Rent \$/SF</i>
<b>For-Sale Prototypes</b>				
1) Single Family Detached	10 du/acre	2,500 sq. ft.	\$950,000	\$380/SF
2) Townhomes/Attached	20 du/acre	2,000 sq. ft.	\$800,000	\$400/SF
3) Condominiums (Stacked Flats)	50 du/acre	1,000 sq. ft.	\$590,000	\$590/SF
<b>Rental Prototype</b>				
4) Apartments	60 du/acre	900 sq. ft.	\$2,800	\$3.11/SF

Source: *Prototype densities and unit sizes by KMA in collaboration with City of Hayward; prices and sale prices estimated by KMA.*

The prototypes were developed largely based upon the characteristics of residential development projects recently built and in the development pipeline in Hayward. The following table lists the development pipeline projects in Hayward, which is illustrative of the range of housing types and the geographic dispersion of projects throughout the City.

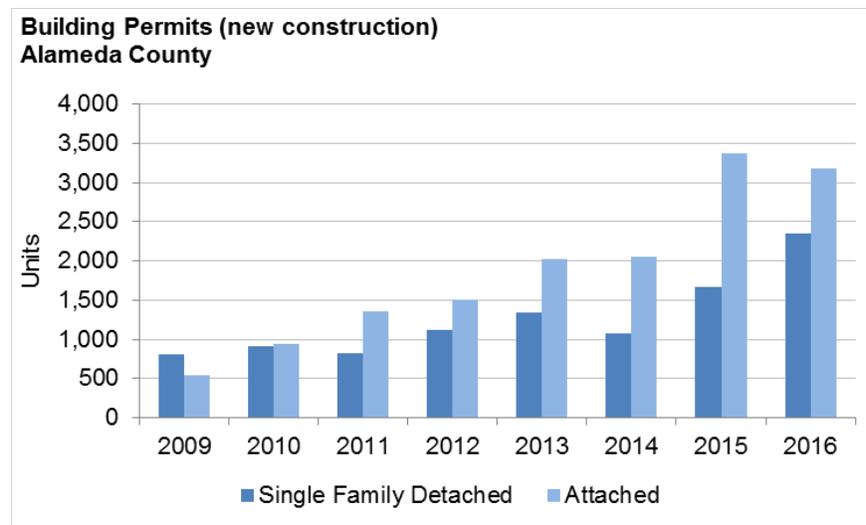

<b>Development Pipeline Projects, City of Hayward</b>		
<i>Project</i>	<i>Address</i>	<i>Unit Type</i>
Maple & Main	22455 Main St	High Density Apartments (mixed use)
Lincoln Landing	22301 Foothill Blvd	High Density Apartments (mixed use)
Campways	28168 Mission Blvd	Apartments
Mission Seniors	29312 Mission Blvd	High Density Condos & Single Family
Matyas Village	22634 Second St	High Density Condos
Mission Village	411 Industrial Pkwy	Townhomes
Haymont Village	Mission & Sorenson (NWC)	Townhomes & Apartments
Mission Crossings	25501 Mission Blvd	Townhomes & Hotel
Ward Creek Cottages	Walpert & 2 <sup>nd</sup> (SWC)	Single Family Detached
Hesperian	2475 Hesperian Blvd	Single Family Detached

Source: *City of Hayward*

### III. MARKET SURVEY & PRICING ESTIMATES

#### A. Residential Building Activity

The City of Hayward and Alameda County as a whole have experienced significant new residential development in the years following the recession. New development has taken the form of both low-density single family detached homes, which is characteristic of the historic development patterns in suburban portions of the county, as well as higher density attached homes, condominiums, and multi-family apartments. Only in recent years have real estate market conditions supported the development of higher density multi-family projects in Hayward and other suburban East Bay communities. As shown in the table above, there are higher density multi-family projects in Hayward’s development pipeline today.

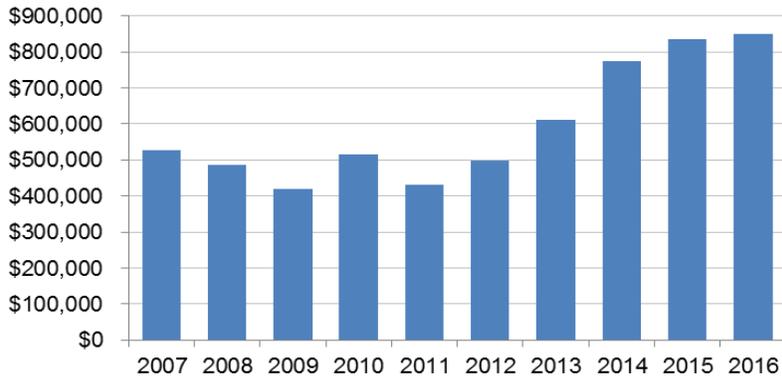

Source: Real Estate Research Council

#### Overview of For-Sale Market

Home prices in Hayward and throughout Alameda County have risen significantly in the last several years due to the strength of the regional economy, low mortgage interest rates, and limited housing market supply. New home prices now well exceed pre-recession levels, even on an inflation adjusted basis, although the pace of price escalation has moderated in more recent years.

**New Home Prices  
Alameda County**

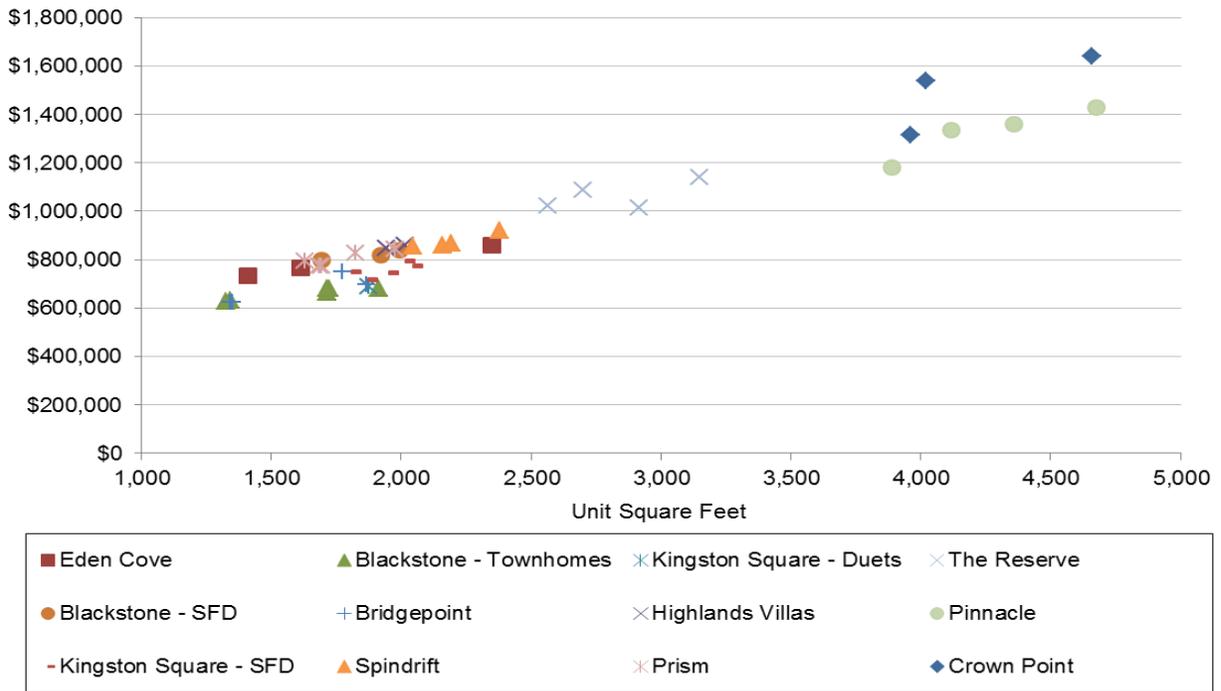

Source: Dataquick

**B. Recent Home Prices of Newly Built Units**

At the time of the market survey in mid-July 2017, 12 new for-sale housing developments were being tracked by market data firm Real Estate Economics. Most of the new homes on the market were attached townhome-type units and single family detached homes up to 2,500 square feet. There were two developments in the Hayward hills with large homes in the 4,000 to 5,000 square feet range. There were no stacked flat condominiums on the market.

**Sale Prices of New Home Developments  
City of Hayward**

Source: Real Estate Economics (July 2017)

### C. For-Sale Prototype Price Estimates

The sale prices of new homes on the market, combined with an analysis of resales of existing homes, formed the basis for KMA’s price estimates. It is noted that there were no comparable units on the market for the stacked flat condominium prototype. Therefore, pricing for this prototype was estimated based upon smaller townhome-type units on the market and adjusted for unit size, density, and location.

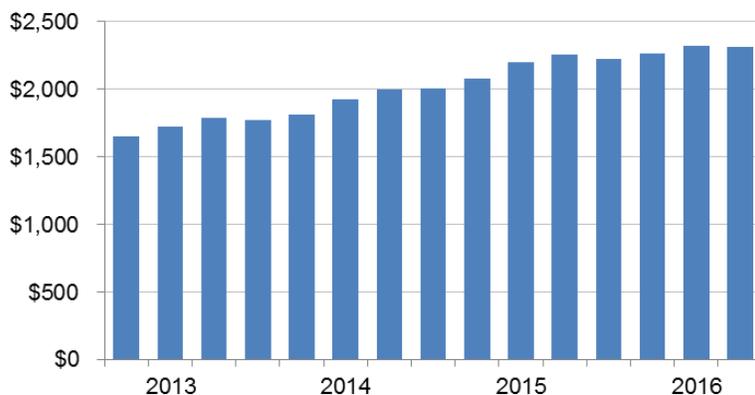

The table below summarizes KMA’s conclusions regarding for-sale prototype unit sizes and pricing.

For-Sale Prototype Price Estimates			
	Unit Size	Price	\$/SF
Single Family Detached	2,500 sq. ft.	\$950,000	\$380
Townhomes/Attached	2,000 sq. ft.	\$800,000	\$400
Condominiums (Stacked Flats)	1,000 sq. ft.	\$590,000	\$590

### D. Rental Housing Market

In recent years, apartment market conditions have improved throughout Alameda County as exhibited by rising rents and occupancy rates. In addition, new development projects have been built and are in the development pipeline throughout the county, particularly near public transit and in mixed use downtown settings where access to job centers and neighborhood services is convenient. For example, new apartment developments were recently completed near the South Hayward and Union City BART Stations (The Cadence and Union Flats). Four market rate rental developments are current in the City of Hayward’s development pipeline including Lincoln Landing, Maple and Main, Campways and Haymont Village (also includes townhomes).

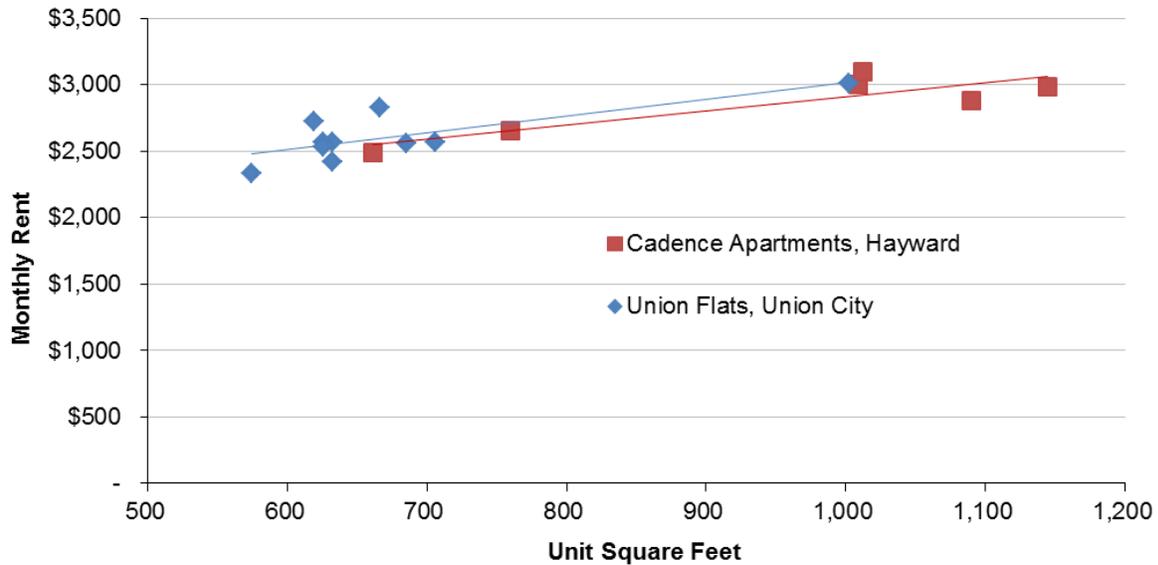

**Average Apartment Rents (Quarterly)  
Alameda County**

Source: RealAnswers

Current market rents for the Cadence and Union Flats projects are shown in the chart below. Based on these rent comps, KMA estimates the average monthly rent for the apartment prototype (new construction) would be in the range of \$2,800 for the 900 square foot apartment prototype.

**Apartment Rent Comparables - Newly Built Properties  
Hayward, Union City**

<sup>1</sup> The methodology utilized by the California Employment Development Department (EDD) assumes that hourly paid employees are employed full-time. Annual compensation is calculated by EDD by multiplying hourly wages by 40 hours per work week by 52 weeks.

<sup>2</sup> Occupation percentages are based on the 2016 National Industry - Specific Occupational Employment survey compiled by the Bureau of Labor Statistics. Wages are based on the 2016 Occupational Employment Survey data applicable to Alameda County updated by the California Employment Development Department to 2017 wage levels.

<sup>3</sup> Including occupations representing 3% or more of the major occupation group

<sup>1</sup> The methodology utilized by the California Employment Development Department (EDD) assumes that hourly paid employees are employed full-time. Annual compensation is calculated by EDD by multiplying hourly wages by 40 hours per work week by 52 weeks.

<sup>2</sup> Occupation percentages are based on the 2016 National Industry - Specific Occupational Employment survey compiled by the Bureau of Labor Statistics. Wages are based on the 2016 Occupational Employment Survey data applicable to Alameda County updated by the California Employment Development Department to 2017 wage levels.

<sup>3</sup> Including occupations representing 3% or more of the major occupation group
