Project No. 25541, City of Hayward Planning Application #202002474

May 2021

EXECUTIVE SUMMARY

This report presents the findings and conclusions of the local transportation analysis conducted by Kittelson & Associates for the proposed Hayward Retail Center project (project) located in Hayward, California. This report documents the non-California Environmental Quality Act (CEQA) local transportation analysis conducted for this project and complements the CEQA transportation impact analysis documented in the *CEQA Transportation Analysis Report*.

The project is located at the former Kmart site at 26231 Mission Boulevard at the southwest corner of Mission Boulevard / Harder Road (assessor's parcel number 452-0020-009-01). The project would consist of:

- An approximately 3,267 square-foot drive-through restaurant,
- An approximately 3,879 square-foot drive-through restaurant, and
- An approximately 88,000 square-foot commercial building, subdivided into nine tenants ranging from approximately 1,800 square feet to approximately 32,000 square feet.

SUMMARY OF FINDINGS

The *CEQA Transportation Analysis Report* determined that the project would not be expected to contribute additional vehicle miles traveled (VMT) under the City of Hayward's (City's) Senate Bill 743-consistent VMT criteria. Therefore, it was determined that the project would result in a **less-than-significant** transportation impact under CEQA. No mitigation measures were identified.

It is recommended that the following non-CEQA recommendations identified in this Local Transportation Assessment ("LTA"), be incorporated as part of this project:

- Install a traffic signal at Harder Road & Dollar Street. With signalization, the intersection would operate within City level-of-service (LOS) standards. A signal would bring operations at the intersection to within City LOS standards in Existing Plus Project and Cumulative Plus Project weekday AM and PM peak hour conditions. Since the project results in operational deficiencies under the Existing Plus Project scenario and this intersection serves as a primary project access driveway, the project's fair share contribution to improvements is 100%.

Signalization of this intersection would provide an additional controlled pedestrian crossing of Harder Road (current crossing opportunities at Mission Boulevard and at Jane Street are approximately 1,100 feet apart) and would improve pedestrian access to and from the project site. A signal would also provide dedicated phases for controlled access into and out of the project site, including northbound drivers and westbound left-turning drivers who would otherwise need to identify gaps in traffic.

Separate simulation analysis, documented in the memorandum included in Appendix 8, demonstrated that the signal is feasible from an operations standpoint. That memorandum included the following recommendations for the traffic signal:

- Provide a dedicated left-turn lane and a shared right/through lane on the northbound approach at Harder/Dollar. The project proposed site plan can accommodate a 11-foot-wide left-turn lane, an 11-foot-wide through/right turn lane, and a 13-foot, 9-inch-wide southbound receiving lane while retaining sidewalks on both sides of the roadway.
- Connect the Harder/Dollar signal controller to the existing SCATS coordinated system at Mission/Harder. Per City staff advisement, coordination would also require connecting the controller at Harder Road & Jane Avenue to the system. This connection along Harder Road from Mission Boulevard to Jane Avenue would create a larger coordinated system that would adjust signal cycles dynamically to maintain smooth traffic flow through the new traffic signal at Harder Road/Dollar Street while allowing phasing to be responsive to future traffic demands.
- Install KEEP CLEAR pavement markings within the Harder/Dollar intersection.
- Install high-visibility continental or ladder-style crosswalks and provide pedestrian signal phases across the three newly-marked crosswalks (across the east, west, and south legs). The signal should include pushbutton actuation for pedestrians and an accessible pedestrian signal (APS).
- Include at least a four-second leading pedestrian interval (LPI) in the signal timing for all four pedestrian phases, which would give pedestrians a head start crossing the intersection and improve their visibility to right-turning motorists.
- Stripe two-stage turn queue boxes for both eastbound and westbound left turns for people biking. Pages 25-26 of Appendix D of the Hayward Bicycle and Pedestrian Master Plan (BPMP) include details and guidance for designing and installing the treatment.
- Install an advanced stop bar (“bike box”) on the eastbound approach to Harder/Dollar for people biking to position themselves in front of drivers turning right at Dollar Street or at Mission Boulevard. Details and design guidance are provided on pages 23-24 of Appendix D to the BPMP.
- Provide green “crossbike” markings to continue the bicycle lane through the intersection and clearly delineate space for people biking through the intersection along Harder Road eastbound and westbound. Pages 27-28 of Appendix D to the BPMP include details and design guidance.
- When designing the horizontal geometry for the intersection, consider pulling back the left-turn stop bar to allow for truck over tracking.

Additional recommendation related to site access include:

- Coordinate with the City to provide treatments at the project driveways to reduce the presence of vehicle-pedestrian conflicts and to increase pedestrian and bicycle safety, as part of design review and conditions of approval. Treatments could include:
 - Providing clear sight triangles at project driveways (i.e., free of landscaping and signage) and continuing to disallow parking on the south side of Harder Road and the west side of Mission Street.

- Installing green paint to indicate conflict areas between people biking and people driving at the project driveway and on intersection approaches along Harder Road in the study area.
- The project should coordinate with the City to provide funding for future Class IV separated bike lanes along Harder Road and Mission Boulevard along the project frontages, or in-lieu funding for similar bicycle improvements in the Project vicinity. As an interim treatment, the project should coordinate with the City to provide a striped bicycle facility along Harder Road between Jane Avenue and Dollar Street.
- The project sponsor should coordinate with the City to restripe existing marked crosswalks at Harder Road & Jane Road (#8) as high-visibility (continental) crosswalks, given that Harder Road is a pedestrian high-injury corridor as identified in the BPMP.
- The project should coordinate with the City of Hayward to determine the number and location of on-site short-term and long-term bicycle parking spaces to be provided.
- It is recommended that project tenants prioritize larger trucks (i.e., larger than a 30- or 40-foot long single unit truck) make deliveries to the site outside the peak hours (7:00-9:00 AM and 4:00-6:00 PM) when possible to avoid potential conflicts associated with turning movements at project driveways.

1 METHODOLOGIES AND EXISTING CONDITIONS

The project is located at the former Kmart site at 26231 Mission Boulevard at the southwest corner of Mission Boulevard / Harder Road. The project site and study area are illustrated in Figure 1.

This local transportation analysis is subject to the regulations and standards currently in place (or in place when the project's Planning Application was deemed complete) in the City of Hayward. These standards are outlined in the *Hayward 2040 General Plan – Mobility Element* (2014) and the City of Hayward Interim Traffic Study Guidelines (March 2017).

The analysis methodology used in this report was submitted in a scoping memo and approved by City Transportation Staff prior to commencement of the study.

Figure
1

1.1 INTERSECTION LEVEL OF SERVICE STANDARDS

Goal 4 Local Circulation-M-4.3 of the City of Hayward's 2040 General Plan requires intersections to maintain a peak-hour level of service (LOS) of E or better for signalized intersections. M-4.3 describes this as follows: The City shall maintain a minimum Level of Service E at signalized intersections during the peak commute periods except when a LOS F may be acceptable due to costs of mitigation or when there would be other unacceptable impacts, such as right-of-way acquisition or degradation of the pedestrian environment due to increased crossing distances or unacceptable crossing delays.

Under SB 743, a project's effect on automobile delay shall not constitute a significant environmental impact. Therefore, LOS is included for non-CEQA purposes to determine if local intersections operate acceptably and if the project would result in any operational deficiencies on the local roadway network. This approach is consistent with the City's adopted thresholds of significance and screening criteria.

1.1.1 Signalized Intersections

Signalized intersection improvements should be identified if the project would degrade the AM or PM peak hour conditions from an acceptable LOS E or better under the No Project scenario to an unacceptable LOS F under the Plus Project scenario. The exception to this criterion is when LOS F is determined by the City of Hayward as acceptable due to right-of-way constraints or when there would be unacceptable impacts to other modes of travel, such as bicycle, pedestrian, or transit.

In addition, improvements should be identified at an intersection already operating at LOS F under an Existing or No Project scenario if the addition of project traffic results in an increase of 5.0 seconds or more in the intersection's average control delay.

1.1.2 Unsignalized Intersections

At unsignalized intersections, the need for improvements is based on LOS and delay, and whether any of the following are met:

- Traffic signal warrant,
- Pedestrian signal warrant, or
- All-way stop warrant.

Note that solely triggering a warrant does not trigger the need for an intersection improvement, but the City will at its discretion require or not require a signal be installed, where warranted.

1.1.3 Level of Service Definitions

In this report, LOS is based on the Highway Capacity Manual (HCM) 6th edition definitions, included as Table 1 for ease of reference. The HCM methodology assigns a level of service (LOS) grade to an

intersection based on the delay for vehicles at the intersection, ranging from LOS A to LOS F; LOS A signifies very slight delay with no approach phase fully utilized while LOS F signifies very high delays and congestion, frequent cycle failures, and long queues. For signalized and all-way stop-controlled intersections, the average control delay for all vehicles is assessed; for two-way stop-controlled intersections, the intersection approach with the highest delay is utilized.

Table 1: Level of Service Standards

Level of Service	Delay Per Vehicle (Seconds)	
	Signalized Intersection	Unsignalized Intersection
A	< 10.0	< 10.0
B	> 10.0 to 20.0	> 10.0 to 15.0
C	> 20.0 to 35.0	> 15.0 to 25.0
D	> 35.0 to 55.0	> 25.0 to 35.0
E	> 55.0 to 80.0	> 35.0 to 50.0
F	> 80.0	> 50.0

Source: Highway Capacity Manual

1.1.4 Study Intersections

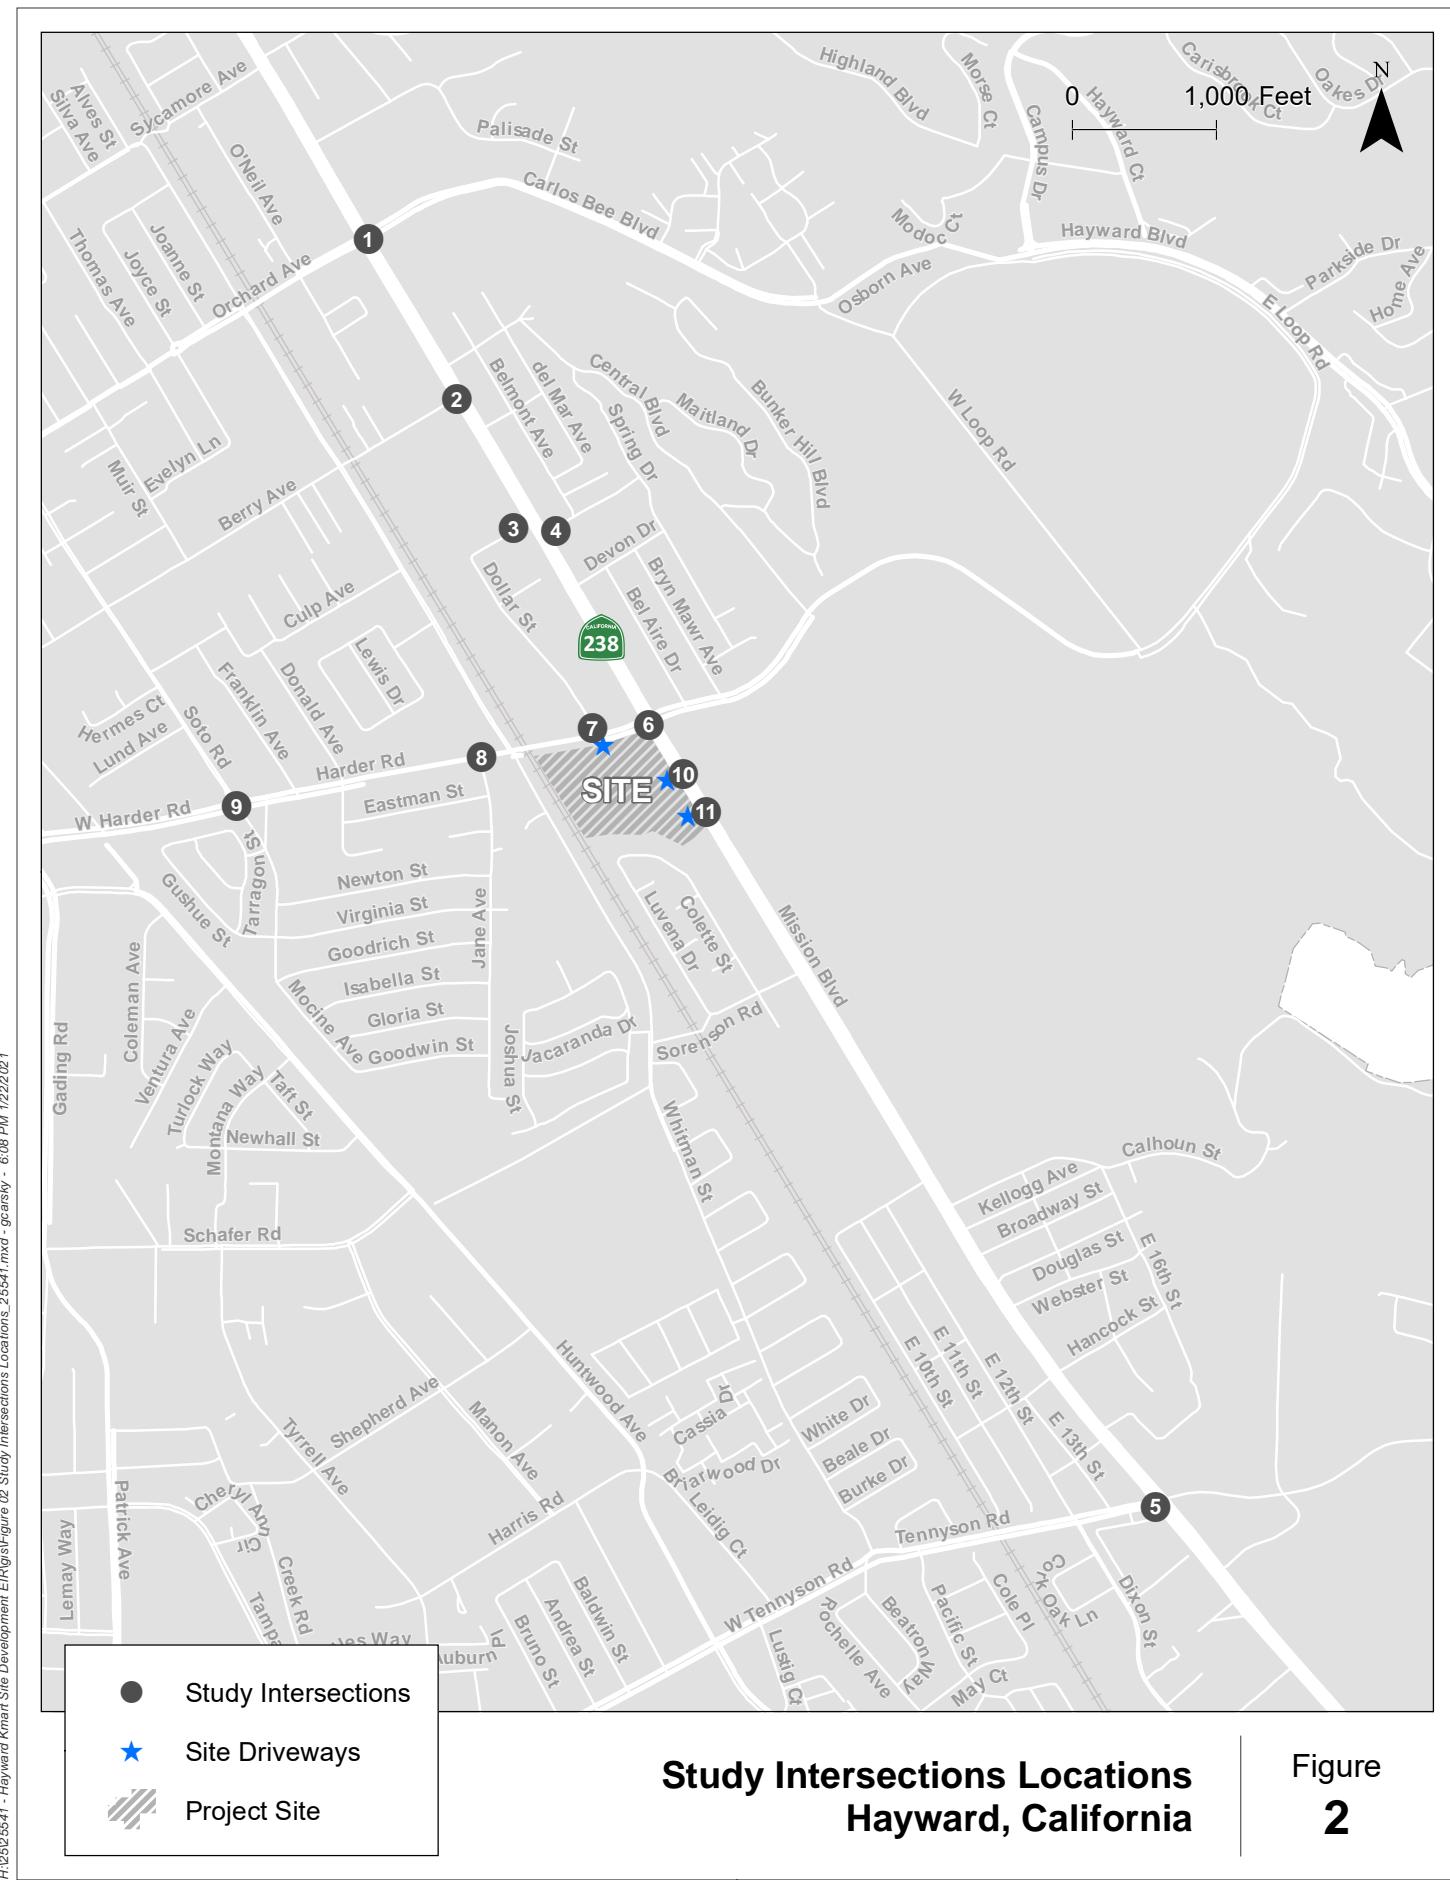

A total of nine study intersections (listed in Table 2 and shown in Figure 2) were selected for the purposes of this analysis. All study intersections are under the City of Hayward's jurisdiction and were selected based on discussions with City staff.

Table 2: Study Intersections

#	Intersection	Traffic Control
1	Mission Boulevard & Carlos Bee Boulevard / Orchard Avenue	Signal
2	Mission Boulevard & Berry Avenue	Signal
3	Mission Boulevard & Torrano Avenue (North)	TWSC
4	Mission Boulevard & Torrano Avenue (South)	TWSC
5	Mission Boulevard & Tennyson Road	Signal
6	Mission Boulevard & Harder Road	Signal
7	Harder Road & Dollar Street	TWSC
8	Harder Road & Jane Avenue	Signal
9	Harder Road & Soto Road	Signal

Note: TWSC signifies a two-way stop-controlled intersection.

1.2 EXISTING NETWORK

1.2.1 Roadways

The roadway system in the study area consists of arterial, collector, and local roadways that serve local and regional traffic demand. The vehicular facilities in the study area are discussed below. Signalized intersections in the study area are shown in Figure 3.

Arterial Roadways

Mission Boulevard is a north-south facility that is classified as a Principal Arterial and designated as a truck route by the City of Hayward. Mission Boulevard runs from Interstate 680 in Fremont to the Interstate 580/Interstate 238 interchange in Castro Valley. Also known as State Route 238 (SR 238), the road splits into two one-way roads north through downtown Hayward: Foothill Boulevard heading northbound and Mission Boulevard heading southbound. Within the study area, Mission Boulevard is a six-lane facility with a center median south of Industrial Parkway. North of Industrial Parkway, Mission Boulevard is primarily a four-lane facility with a center median but widens to a six-lane facility at the intersection approaches and departures at Tennyson Road and Industrial Parkway. Travel lanes are typically 11 feet wide, and on-street parking is available when the facility is four lanes wide. The curb-to-curb right-of-way is approximately 80 feet and widens up to 106 feet at its widest around intersections. The posted speed limit is 40 miles per hour (mph).

Harder Road is classified as a Collector east of Mission Boulevard and a Minor Arterial west of Mission Boulevard; it is also classified as a truck route west of Mission Boulevard. There are two 11- to 16-foot travel lanes in each direction as well as a median. The curb-to-curb right of way varies from 80 to 90 feet. East of Mission Boulevard there is a significant uphill grade of 8% traveling eastbound. The posted speed limit is 35 mph.

Tennyson Road is an east-west Principal Arterial and truck route (west of Mission Boulevard) that runs from Mission Boulevard west to the South Hayward Bay Area Rapid Transit (BART) station, Interstate 880, and Industrial Boulevard. East of Mission Boulevard, Tennyson Road is classified as a local road and connects to one of the proposed project access points. The road is a four-lane facility with a center median within the study area. Travel lanes are typically 12 feet wide, and there is on-street parking available on both sides of the roadway. The curb-to-curb right-of-way is approximately 90 feet wide. The posted speed limit varies between 25 and 35 mph.

Collector Roadways

Whitman Street is a north-south Collector that runs from Tennyson Road north toward Jackson Street, running parallel to the BART railroad tracks. The road connects to several schools, including Cesar Chavez Middle School, Tennyson High School, and Harder Elementary School. The road is a two-

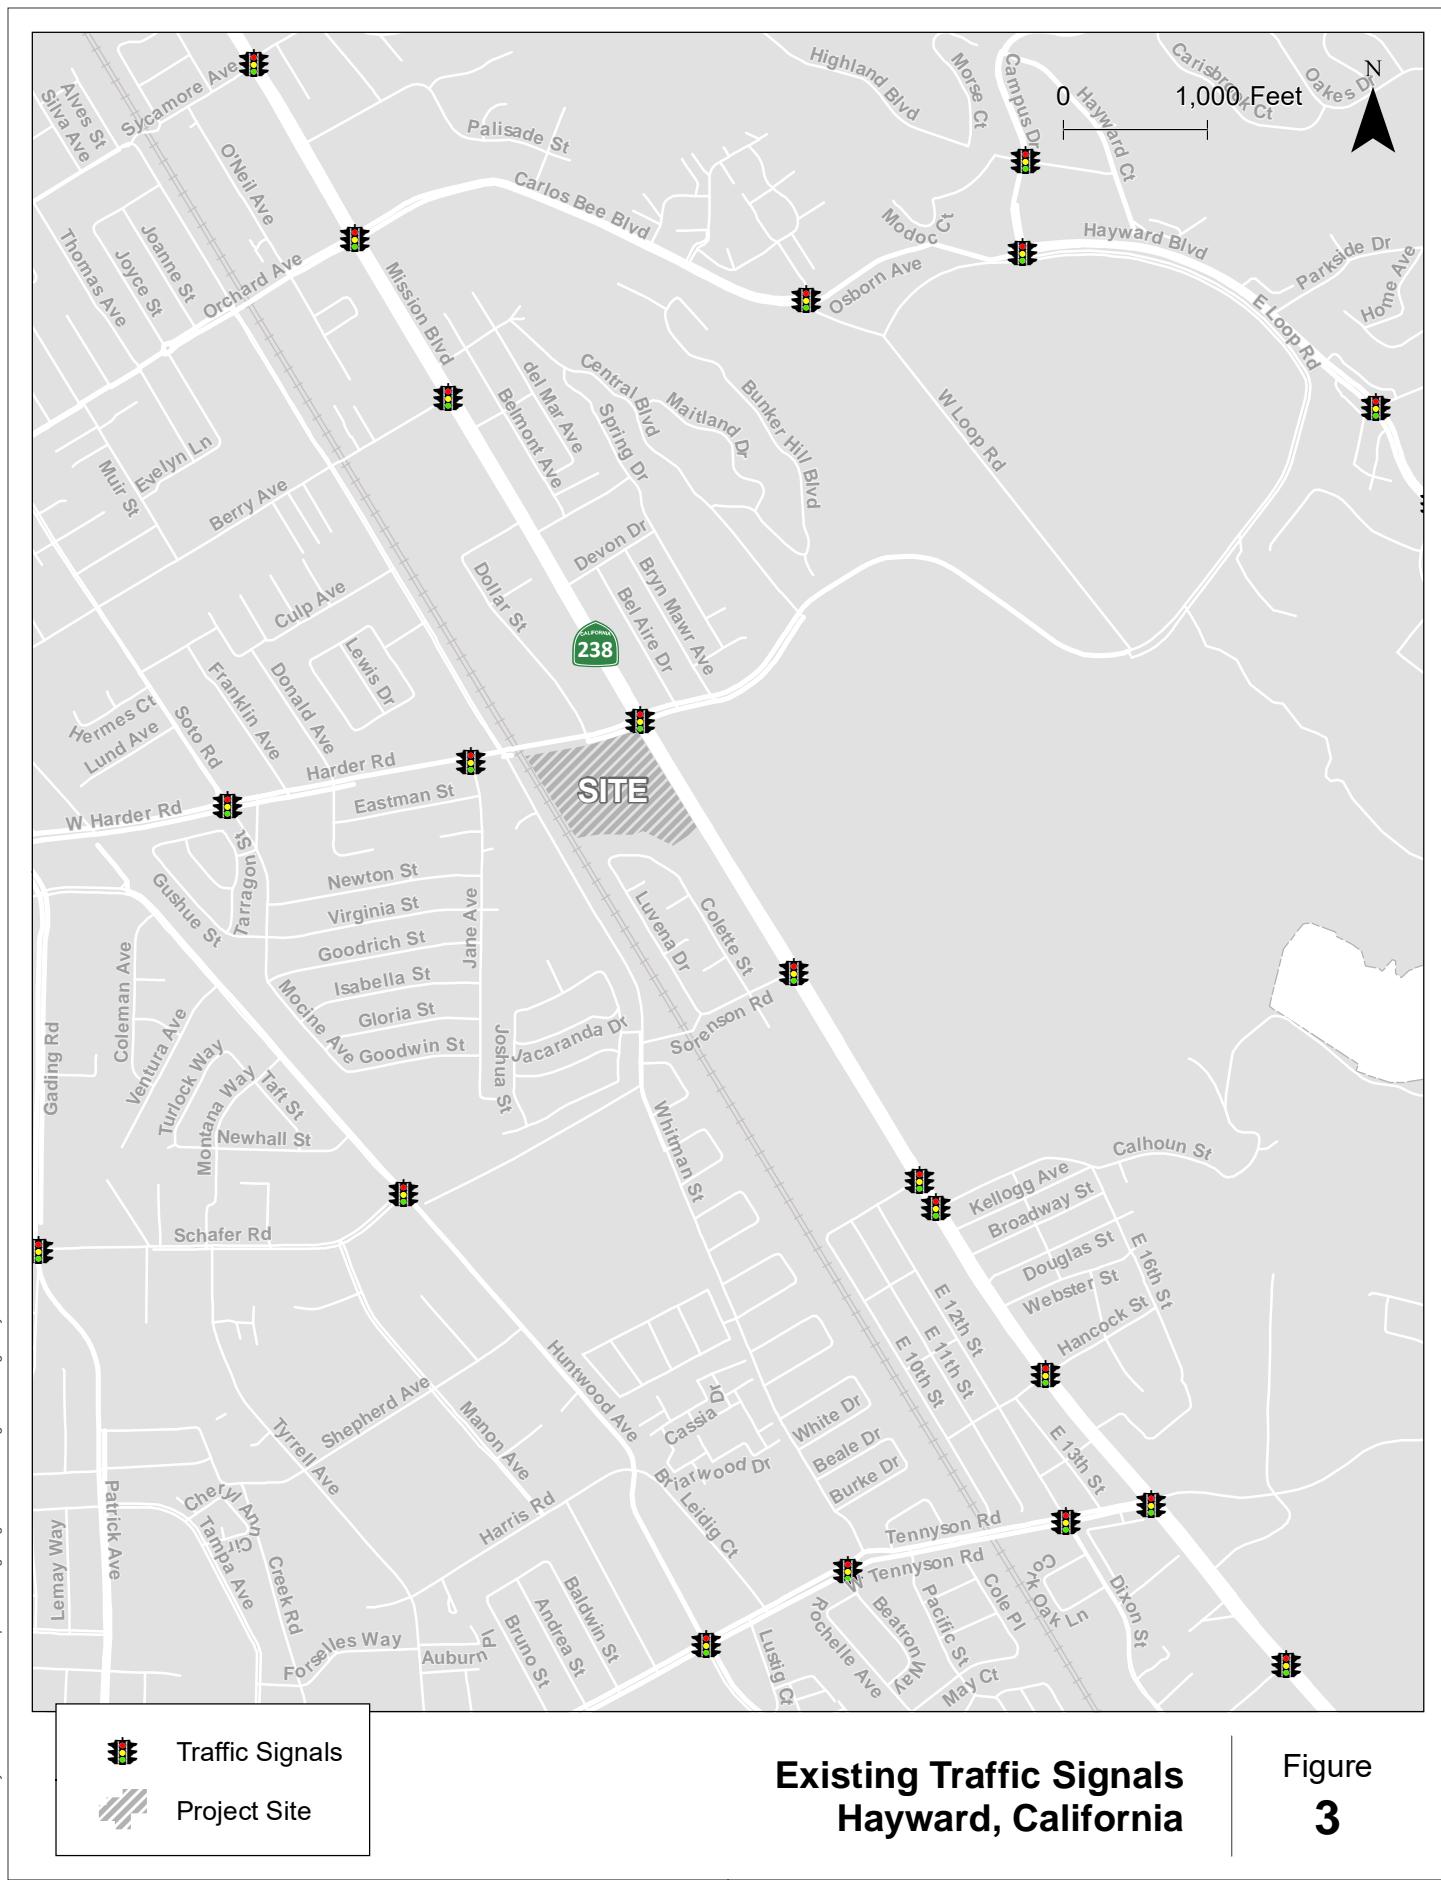

lane undivided facility with 11-foot travel lanes and on-street parking on both sides of the road. The curb-to-curb right-of-way is approximately 44 feet. The posted speed limit is 25 mph.

Soto Road is a north-south collector road that connects to Harder Road to the south and terminates at Winton Avenue to the north, providing access to residential areas and State Route 92 (Jackson Street). It has one travel lane in each direction. Sidewalks are provided along both sides of the street. On-street parking is allowed along the majority of the road.

Local Roadways

Jane Avenue starts at Whitman Street, runs through Harder Road, and terminates at a cul-de-sac of a residential development south of Harder Road. It has one travel lane in each direction except along the short stretch providing access between Harder Road and Whitman Street, where two lanes are present in each direction. Sidewalks are provided on both sides of the street. On-street parking is allowed south of the intersection with Harder Road.

Dollar Street is a north-south local road west of Mission Boulevard that runs from Torrano Road and terminates at the project site at Harder Road. Dollar Street has one lane in each direction and a short segment with a two-way left turn lane. On-street parking is allowed on Dollar Street, and the curb-to-curb right-of-way is about 45 feet, with short sections somewhat wider. Dollar street is stop controlled at Harder Road with a marked east-west pedestrian crossing at the intersection.

1.2.2 Transit Service

The transit system in the study area consists of local bus and regional rail service. The transit facilities in the study area are discussed below and shown in Figure 4.

Alameda-Contra Costa Transit District

Alameda-Contra Costa Transit District (AC Transit) provides bus service in the study area. AC Transit bus routes and local bus stops are shown in Figure 4. In addition, weekday bus service in the study area is documented in Table 3.

Table 3: Existing AC Transit Weekday Service

Route	Beginning and End Points		Peak / Off-Peak Frequency (in Minutes)
	North/West	South/East	
99	Hayward BART	Fremont BART	20/20
801	San Leandro BART	Fremont BART	N/A / 30
41	Hayward BART	Union Landing Transit Center	60/60

Source: AC Transit, January 2021

There are two bus lines that run along Mission Boulevard in the study area. AC Transit Line 99 runs along Mission Boulevard on weekdays between 5:00 AM and 11:59 PM (starting at 6:00 AM on weekends and with 30-minute headways), with connections to the Hayward BART and South Hayward BART stations, before turning south onto Decoto Road into Union City and the Union City BART station, and then heads east onto Fremont Boulevard into Fremont and the Fremont BART station. AC Transit Line 801 (an “All-Nighter” route) provides daily service to San Leandro, Hayward, Union City, and Fremont primarily along Mission Boulevard between 12:00 AM and 7:00 AM primarily along Mission Boulevard during the hours that Line 99 does not run. As a result, there is 24-hour bus service along Mission Boulevard.

There is one southbound bus stop near the project along Mission Boulevard immediately south of Harder Road and north of the project site’s north Mission Boulevard driveway. There are two northbound bus stops along Mission Boulevard near the project; one is located about 250 feet north of Harder Road and one is located about 1,000 feet south of Harder Road (just south of the project site’s southernmost Mission Boulevard driveway). At the stop north of Harder Road, there is a transit shelter with covered benches and lighting. At the other two stops, there are no amenities for transit users other than a bus stop sign with the route numbers.

Line 41 also runs in the project’s vicinity in the study area and provides service between Union Landing Transit Center and Hayward BART. The line runs north-south along primarily Whitman Street (north of the project site) and Huntwood Avenue (south of the project site). The closest Line 41 stops to the project site are on Whitman Street north of Harder Road. Pedestrian access to these two bus stops to and from the project site would require walking along Harder Road under the Whitman

Street overpass and traveling north along Jane Avenue. At these two stops, there are no amenities for transit users other than a bus stop sign with the route numbers.

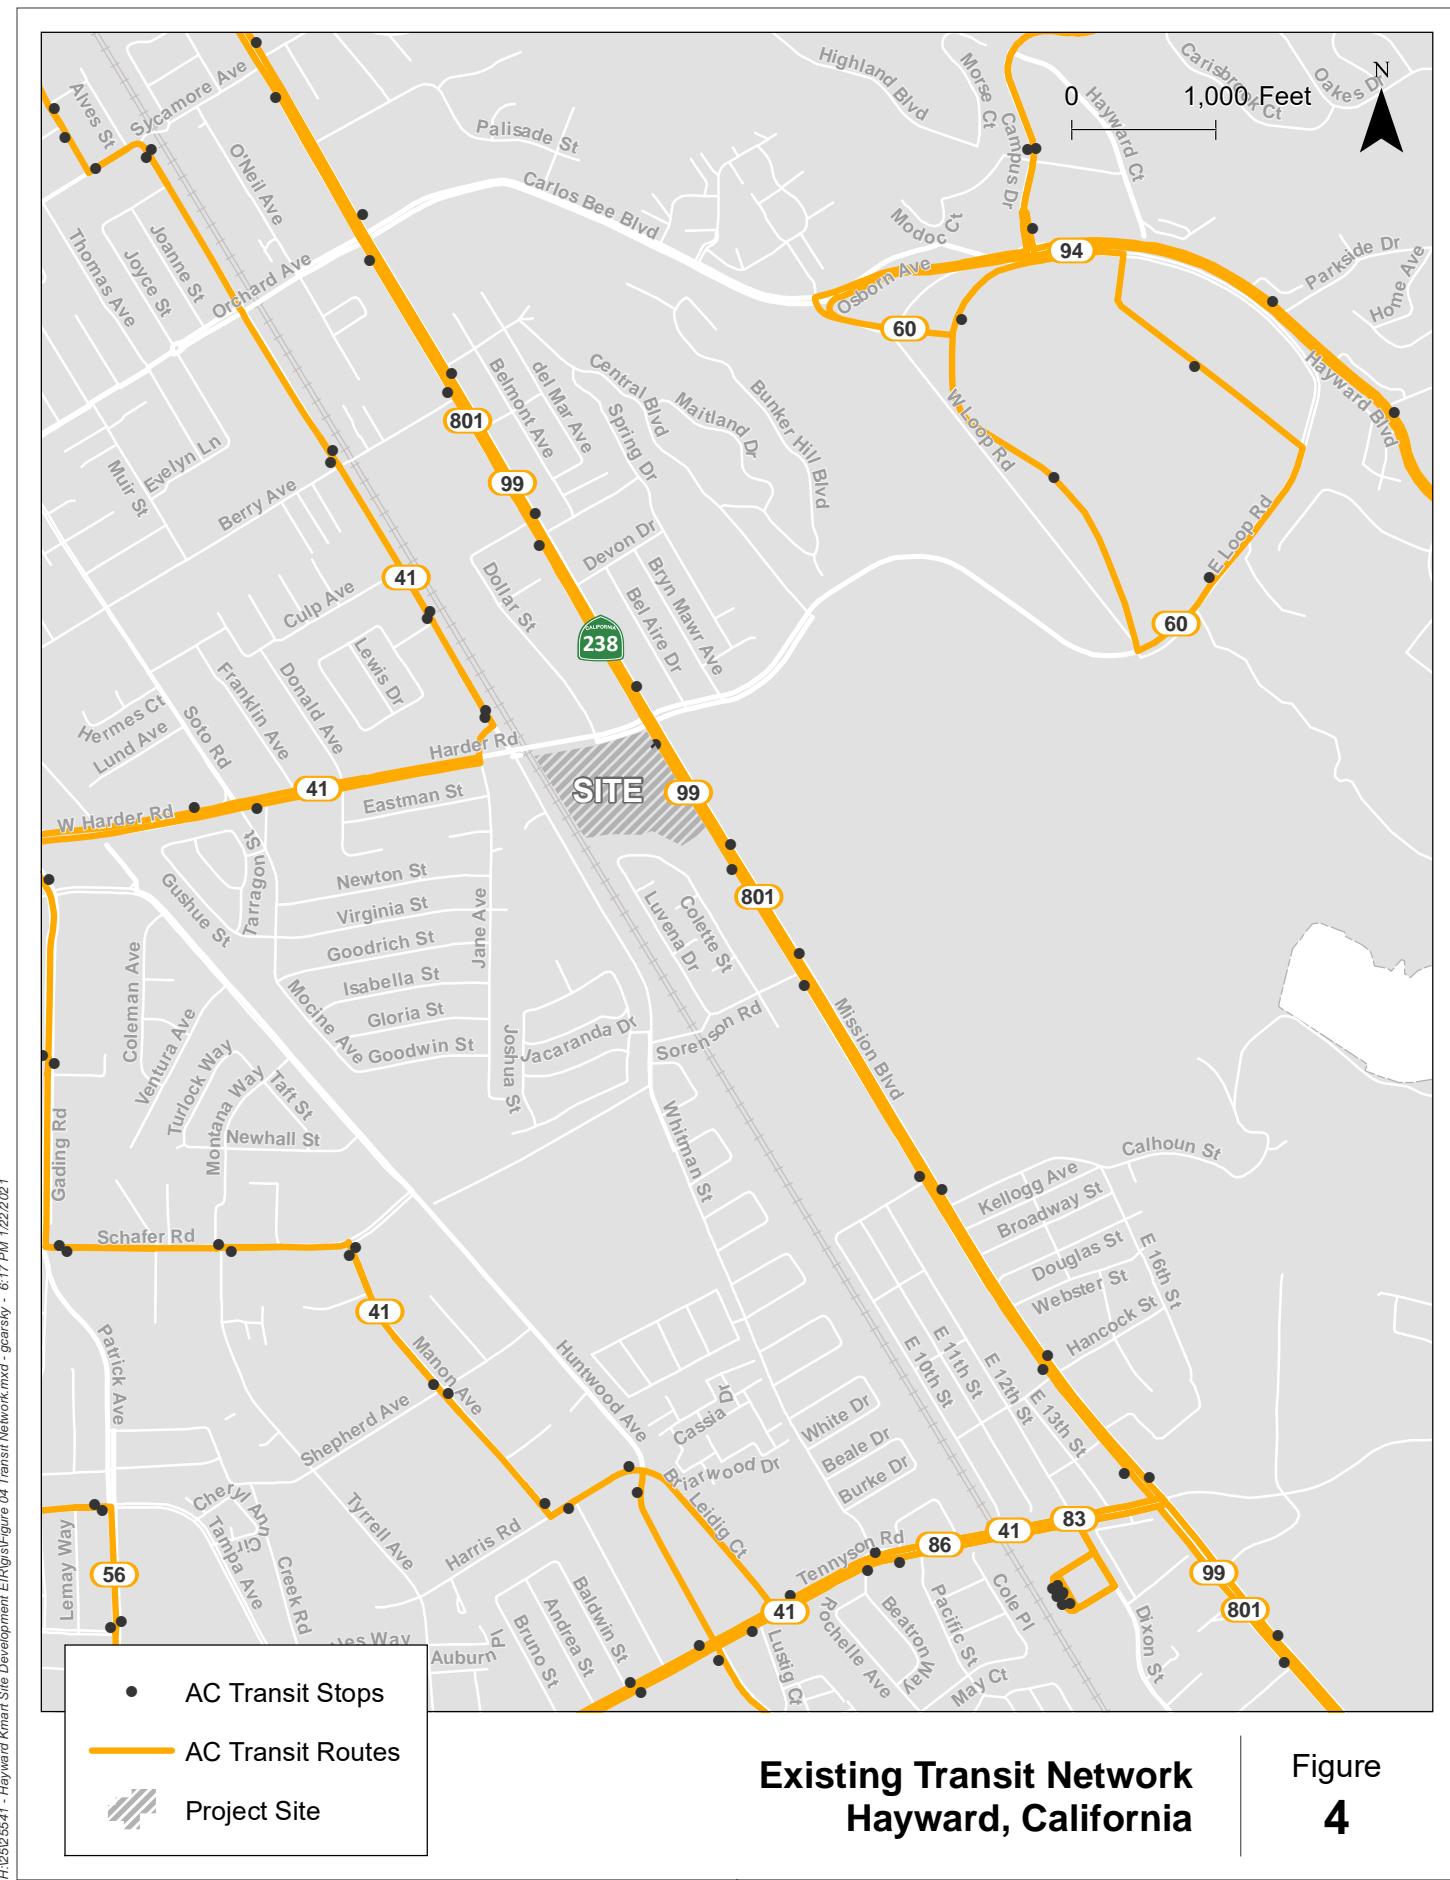

Bay Area Rapid Transit

The South Hayward Bay Area Rapid Transit (BART) station near the Mission Boulevard/Tennyson Road intersection is a major transit hub and a key transfer point for BART-to-bus and bus-to-bus connections. There are nine bus bays serving four AC Transit routes at the South Hayward BART station. BART operates regional heavy rail service connecting San Francisco, San Mateo, Alameda and Contra Costa Counties. The Berryessa-Richmond and Berryessa-Daly City lines run through the South Hayward BART station. Each line generally operates at 15-minute headways during peak periods, resulting in an average peak period frequency of 7.5 minutes at the station. However, due to the ongoing COVID-19 pandemic, each line currently operates on longer 30-minute headways.

The South Hayward BART station is approximately 1.2 miles to the south of the proposed project site by foot.

Other Transit Services

The Hayward Greyhound bus station is located 1.8 miles north of the study area at the Hayward BART station. In addition, the Hayward Amtrak Station is located approximately 2.3 miles northwest of the project site; the Hayward Amtrak station is part of the Capitol Corridor operating between San Jose and Sacramento.

1.2.3 Pedestrian Facilities

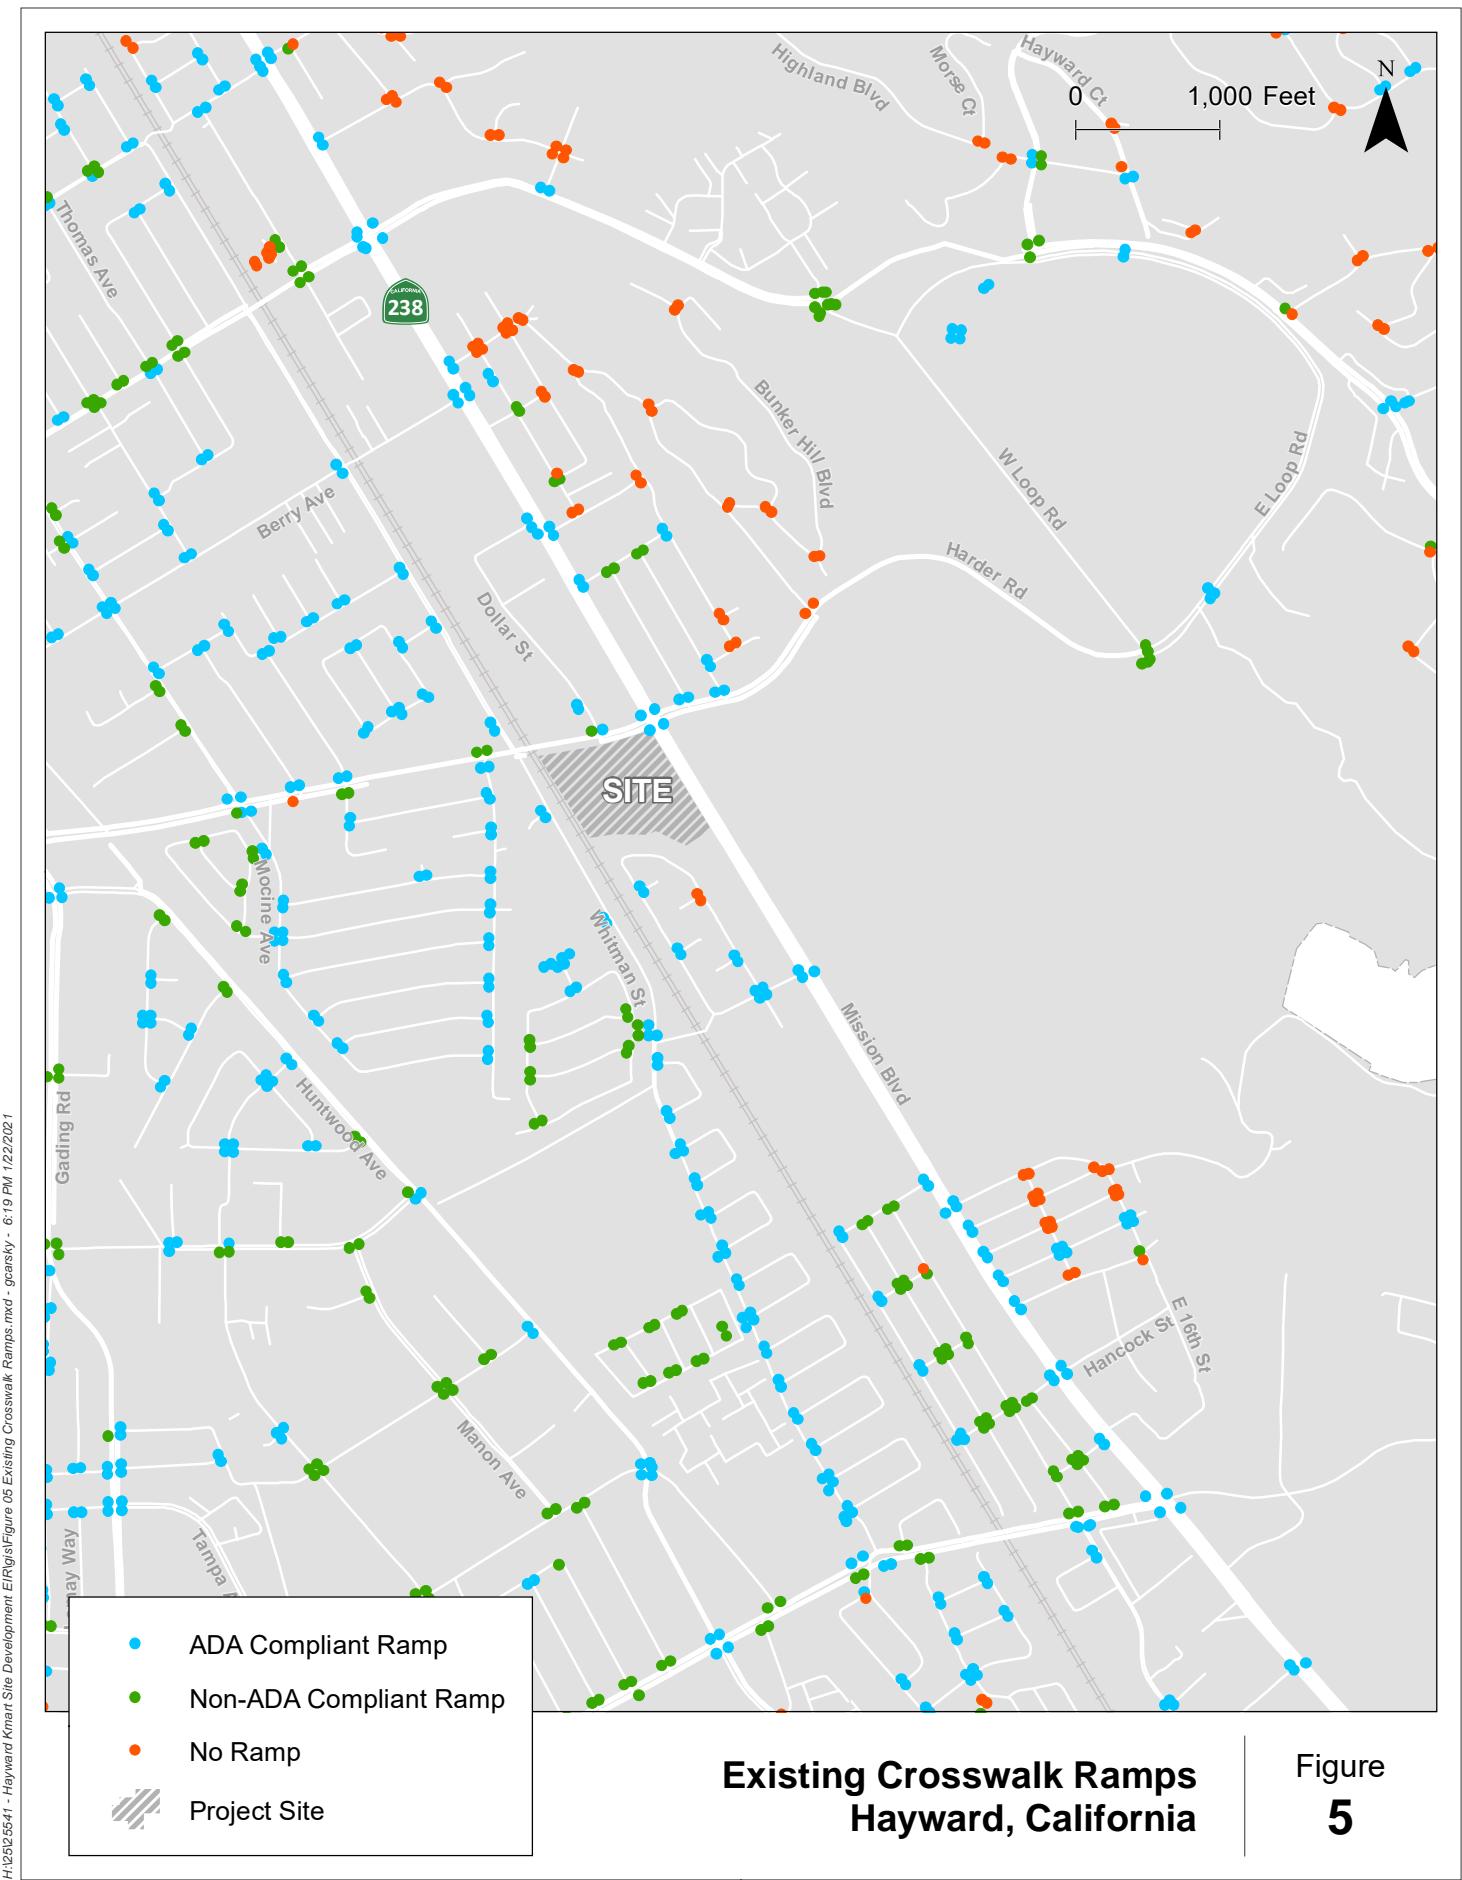

The study area offers several types of facilities and amenities that support walking. The availability and quality of pedestrian facilities can be analyzed using seven key factors as shown in Table 4.

Table 4: Pedestrian Facility Conditions

Factor	Description	Assessment
 Sidewalk Availability	Sidewalk availability is core to supporting walkability and safety separating pedestrians from vehicles and other modes. In addition, it is important that sidewalks are present on <u>both sides</u> of the roadway and are available along the entire segment rather than end midblock.	The Arterial roadways within the study area have sidewalks on both sides of the roadway with no gaps. For the most part, Collector roadways have complete sidewalk coverage, as well. The Local roads in the study area generally have complete sidewalks.
 Sidewalk Conditions	Cracked, broken, or otherwise damaged sidewalks can pose a safety hazard and discourage walking.	Where sidewalks exist, they are generally in good condition free of cracks, breaks, or visible damage.
 Crosswalk Availability	Marked crosswalks can safely accommodate pedestrians that need to cross streets. A lack of marked crosswalks could hinder walkability since pedestrians need to travel greater distances to reach a safe marked crossing point. Drivers may also be less likely to yield to intersections at unmarked crossings.	<p>Within the study area, there are marked crosswalks at all signalized intersections. Along Harder Road, the unsignalized intersections include marked crossings across the minor streets only (i.e., not across Harder). One marked crosswalk with a Rectangular Rapid Flashing Beacon is provided on the west leg of the Harder Road & Franklin Avenue intersection. All of the marked crossings on Mission Boulevard are high-visibility continental crosswalks with curb ramps and detectable warning strips with tactile domes.</p> <p>The following marked crossings along Harder Road are also high-visibility continental crossings:</p> <ul style="list-style-type: none"> • The north leg of Harder Road & Dollar Street. The northwest corner does not include a detectable warning strip on the curb ramp. • The west leg of Harder Road & Franklin Street. The southern end of the crossing does not include a curb ramp but ends partially in a driveway. <p>The following marked crossings along Harder Road have basic transverse markings, painted yellow to indicate the presence of a school:</p> <ul style="list-style-type: none"> • All crossings at Harder Road & Soto Road • North leg of Harder Road & Franklin Street • North and south legs of Harder Road & Donald Avenue/Eastman Court. The southwest corner does not include a detectable warning strip on the curb ramp. • All four legs of Harder Road & Jane Avenue and Harder Road & Soto Road. The northwest and northeast

Factor	Description	Assessment
		<p>corners at Jane Avenue do not include detectable warning strips on the curb ramps. The southwest corner at Soto Road is the only corner in the study area that includes directional curb ramps for crossings.</p> <p>As shown in Figure 5, most intersections in the study area have Americans with Disabilities Act (ADA) compliant curb ramps with tactile strips.</p>
 Shading	<p>Shading, whether natural or artificial, can encourage walking in areas such as Southern California which are relatively warm with limited rainfall, especially in the summer.</p>	<p>Mission Boulevard, with its wide right-of-way, generally lacks shade for pedestrians, especially on the east side of the road. Other arterials, such as Harder Road, have more intermittent shade from street trees.</p> <p>Several Collector and Local roadways have ample shade for pedestrians from street trees or buildings.</p>
 Flat Grade	<p>Steep hills and ravines can discourage walking, especially for pedestrians with limited mobility.</p>	<p>The streets to the west of Mission Boulevard around the study area are generally flat with mild inclines or declines for short stretches. The roads to the east of Mission Boulevard slope upward at a fairly steep angle for pedestrians, which affects east-west pedestrian accessibility from Mission Boulevard. The north-south roads to the east of Mission Boulevard are relatively flat.</p>
 Buffer	<p>Buffers which provide separation between pedestrians and moving vehicles can help improve the walking experience, and can include landscaping, parked vehicles, and bulbouts, which serve to both reduce pedestrian crossing distances at intersections and as a traffic calming measure.</p>	<p>None of the Arterial roadways include a buffer. The other roadways in the study area generally lack buffers, though some local and collector streets include on-street parking which provide a buffer from moving traffic.</p> <p>Some of the residential, lower-volume streets to the east of Mission Boulevard have intermittent landscape buffers.</p>
 Amenities	<p>In addition to physical facilities that accommodate walking, useful or interesting amenities along sidewalks create a more interesting walking environment and increase pedestrian comfort. Amenities can include sidewalk-adjacent retail and restaurants, landscaping, and street furniture.</p>	<p>Street furniture is broadly lacking along the roadways in the study area. As outlined in the transit section above, four of the five bus stops in the immediate project vicinity do not provide any amenities other than a bus stop sign.</p> <p>The arterial roadways in the study area are surrounded by single-family homes, low-rise residential homes, a cemetery, or commercial development that is not amenable to walking (e.g., gas stations, storage facilities).</p> <p>The remaining roadways in the study areas are surrounded by parks and single-family homes.</p>

The City's 2020 BPMP identifies Harder Road, west of the project site between Whitman Street and Soto Road, as a high injury corridor for pedestrians. The BPMP also includes the Harder Road segment between Santa Clara Street and Loop Road (i.e., the full extent of Harder Road) among its near-term implementation corridors, with recommended treatments along the corridor.

1.2.4 Bicycle Facilities

The study area contains a bicycle facilities network that consists primarily of dedicated street space for bicyclists.

Bicycle facilities are categorized into four types, as described below:

- **Class I Bikeway (Bike Path).** Also known as a shared path or multi-use path, a bike path is a paved right-of-way for bicycle travel that is completely separate from any street or highway.
- **Class II Bikeway (Bike Lane).** A striped and stenciled lane for one-way bicycle travel on a street or highway. This facility could include a buffered space between the bike lane and vehicle lane and the bike lane could be adjacent to on-street parking.
- **Class III Bikeway (Bike Route).** A signed route along a street where the bicyclist shares the right-of-way with motor vehicles. This facility can also be designated using a shared-lane marking (sharrow).
- **Class IV Bikeway (Separated Bike Lane).** A bikeway for the exclusive use of bicycles including a separation required between the separated bikeway and the through vehicular traffic. The separation may include, but is not limited to, grade separation, flexible posts, inflexible physical barriers, or on-street parking.

Figure 6 displays the existing designated bicycle facilities in the study area. The existing bicycle facilities near the project site include:

- Class II bicycle lanes on Harder Road in both directions
- Class II bicycle lanes on Whitman Street in both directions
- Parking-adjacent Class II bicycle lanes on Soto Road between Harder Road and Orchard Avenue
- Class III bicycle route on Orchard Avenue / Carlos Bee Boulevard
- Class II buffered bicycle lanes on Huntwood Avenue

The City's BPMP includes the following recommended bicycle improvements in the study area:

- Class IV separated bike lanes on Mission Boulevard throughout the study area
- Class IV separated bike lanes on Harder Road throughout the study area
- Class I multi-use path or Class IV separated bike lanes on Whitman Street throughout the study area

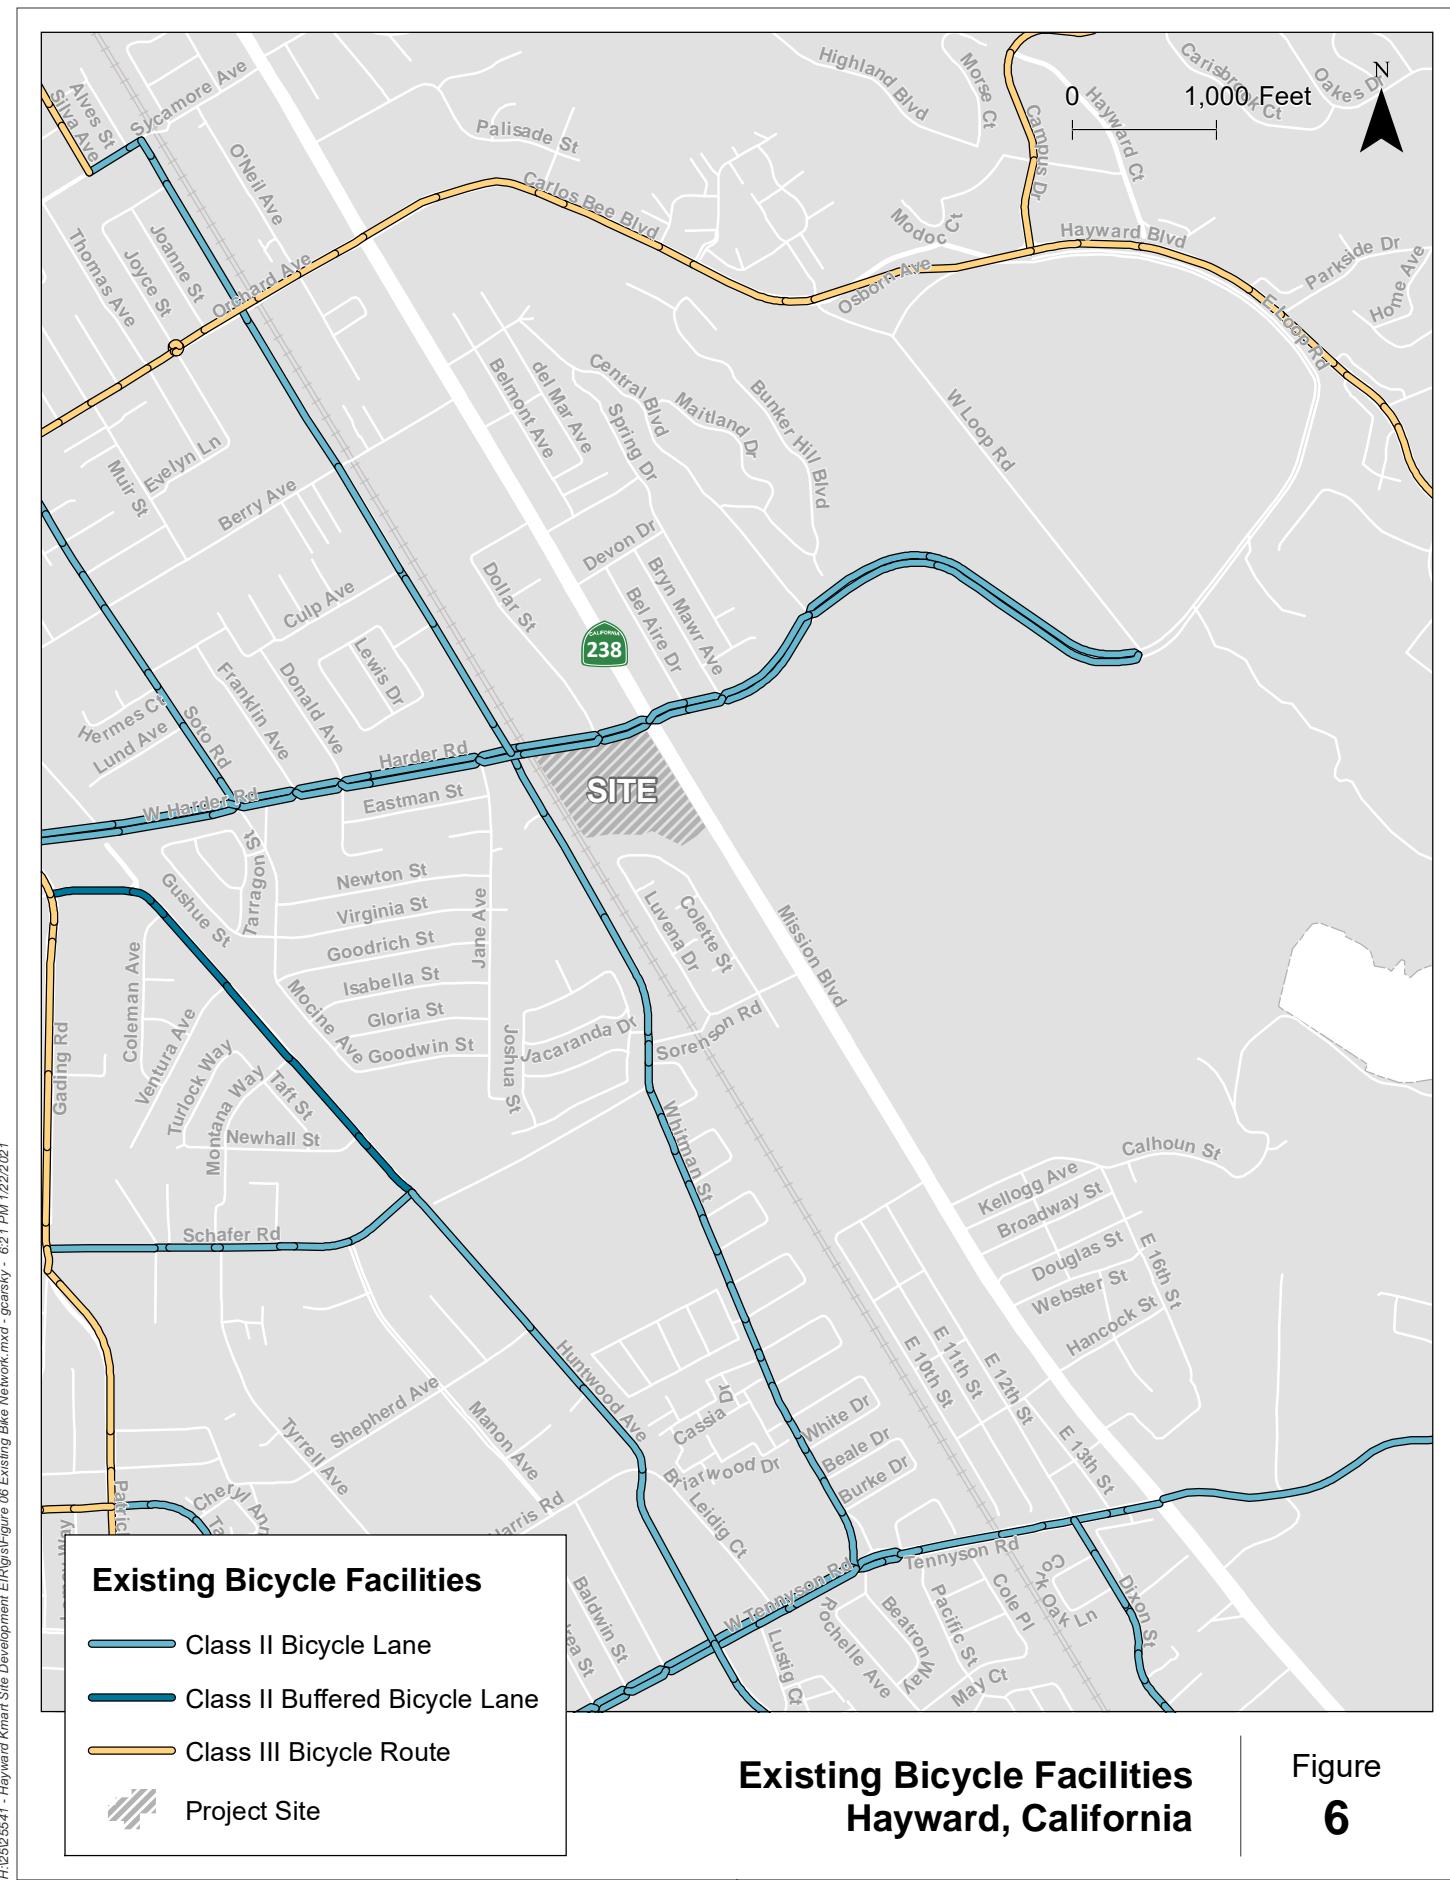

Figure
6

1.3 EXISTING TRAFFIC VOLUMES

1.3.1 Automobile Traffic Volumes

The LTA analysis involves establishing traffic volumes that capture representative existing conditions, which in this case represents typical daily volumes without the presence of the former Kmart site (closed in early 2020). However, because of the timing of the project and this analysis, any currently observed traffic volumes would be severely affected by the COVID-19 pandemic, which has influenced traffic volumes and resulted in lower than typical traffic levels as experienced before the pandemic or would be expected after the pandemic. One approach to arrive at representative traffic volumes is to obtain counts at some locations in present conditions and compare these to common study locations available in previous counts as shown in Table 5. The comparison could establish a percentage basis to adjust observed volumes to pre/post-pandemic levels.

However, available pre-COVID counts all represent conditions before Kmart closed, which makes such an adjustment imprecise because all counts prior to 2020 would reflect a baseline condition with the Kmart operational. An adjustment would therefore reflect pandemic changes and the Kmart closure. Any 2020 counts that include the project's access points currently would show negligible or no site activity and could not be properly adjusted on a percentage basis. The result would be adjusted volumes in aggregate but with misleading adjustments related to site access.

Therefore, no traffic counts taken during the COVID pandemic were used. Traffic volumes available from previous counts were identified and used for the analysis. Table 5 identifies multimodal traffic counts available that were conducted as part of previous studies:

- Harder Elementary School Expansion (2016), located at 495 Wyeth Road;
- Hayward Mission Crossings (2017), located at 25501 Mission Boulevard, on the northwest corner of Mission Boulevard and Torrano Avenue;
- One Subaru (2019), located at 25000 Mission Boulevard, on the southeast corner of Mission Boulevard and Carlos Bee Boulevard; and,
- Meta Housing (2019), located at 29497-29553 Mission Boulevard, on the west side of Mission Boulevard north of Industrial Parkway.

Table 5: Historical Counts at Study Intersections

#	Intersection	Traffic Control	Counts Available by Date		
			June 2, 2016	September 8, 2016	April 10, 2019
1	Mission Boulevard & Carlos Bee Boulevard / Orchard Avenue	Signal		X	X
2	Mission Boulevard & Berry Avenue	TWSC		X	X
3	Mission Boulevard & Torrano Avenue (North)	TWSC		X	X
4	Mission Boulevard & Torrano Avenue (South)	TWSC		X	X
5	Mission Boulevard & Tennyson Road	Signal		X	X
6	Mission Boulevard & Harder Road	Signal	X	X	X
7	Harder Road & Dollar Street	TWSC		X	
8	Harder Road & Jane Avenue	Signal	X		
9	Harder Road & Soto Road	Signal	X		

Note: TWSC signifies a two-way stop-controlled intersection.

Source: June 2, 2016 counts Harder Elementary School Expansion Study; September 8, 2016 counts Hayward Mission Crossings study; April 10, 2019 counts, One Subaru study (Mission Boulevard / Harder Road) and Meta Housing Study (Mission Boulevard / Tennyson Road)

Kittelson compiled these historical traffic counts and arrived at Existing Conditions analysis volumes using the following methodology:

1. Compare total entering vehicles at the Mission/Harder intersection (a site collected among all available dates) across the three count dates presented in Table 5. For intersections #8 and #9 where 2016 counts are the most recent available, apply the average growth observed at other intersections from 2016 to 2019 to “bring them forward” to 2019 conditions (adjust the volumes to show three years of growth observed).
2. Use the most recently available counts for each intersection, with adjustments from Step 1 to adjust them to 2019 levels.
3. Apply a 1 percent growth factor to all volumes to adjust them from 2019 to a 2020 analysis year.

Steps 1 through 3 result in existing conditions analysis volumes that reflect area non-pandemic conditions and localized conditions before Kmart closure (i.e., some level of Kmart traffic is present). The adjusted volumes could then be used in relation to project trip generation.

4. Estimate the traffic volumes related to the former Kmart site based on the Institute of Transportation Engineers (ITE) Trip Generation Manual.
5. Compare analysis volumes at project driveways from steps 1-3 and the estimated Kmart site traffic from step 4. Use these values to estimate an appropriate credit to reduce project trip generation (discussed in next section).

Step 1: Determine Growth Factor between 2016 and 2019

The results of the comparison among Mission Boulevard / Harder Road counts are provided in Table 6. The 2019 counts were 5.6 percent higher in the AM peak hour compared to the average of 2016 counts and 15.2 percent higher in the PM peak hour. These percentages were applied to grow the volumes at intersections #6, #7, and #8.

Table 6: Mission Boulevard / Harder Road Intersection Volumes

Step 2 and 3: Adjust Volumes to 2020 Analysis Volumes

The most recent counts were all adjusted to analysis year 2020 levels to account for background growth from 2016 and from 2019. The final Existing Conditions analysis volumes are presented for each peak hour in Table 7 and Table 8.

Step 4: Estimate Traffic Volumes Associated with Former Kmart

The former Kmart trips were estimated using data provided by ITE land use code 815 (free-standing discount store), as shown in Table 9. The project was estimated to generate 5,020 weekday daily vehicle trips.

Table 9: Former Kmart Trip Generation Estimate

Trip Generation Rates									
Land Use	ITE Code	Rate	Weekday Daily	Weekday AM Peak Hour			Weekday PM Peak Hour		
				In	Out	Total	In	Out	Total
Free-Standing Discount Store	815	per KSF	53.12	69%	31%	1.17	50%	50%	4.83
Trip Generation Estimates									
Land Use	ITE Code	Size (KSF)	Weekday Daily	Weekday AM Peak Hour			Weekday PM Peak Hour		
				In	Out	Total	In	Out	Total
Free-Standing Discount Store	815	94.5	5,020	77	34	111	228	228	456
50% reduction in Existing Use Trip Estimate			2,510	-38	-17	-55	-114	-114	-228
<i>Pass-by Reduction (17% in PM) – Applied to 50% Trip Estimate</i>			-	n/a	n/a	n/a	-19	-20	-39
NET PROJECT TRIPS TO BE APPLIED			2,510	39	17	56	95	94	189

Source: Kittelson & Associates, Inc., 2021; ITE Trip Generation Handbook, 10th Ed.

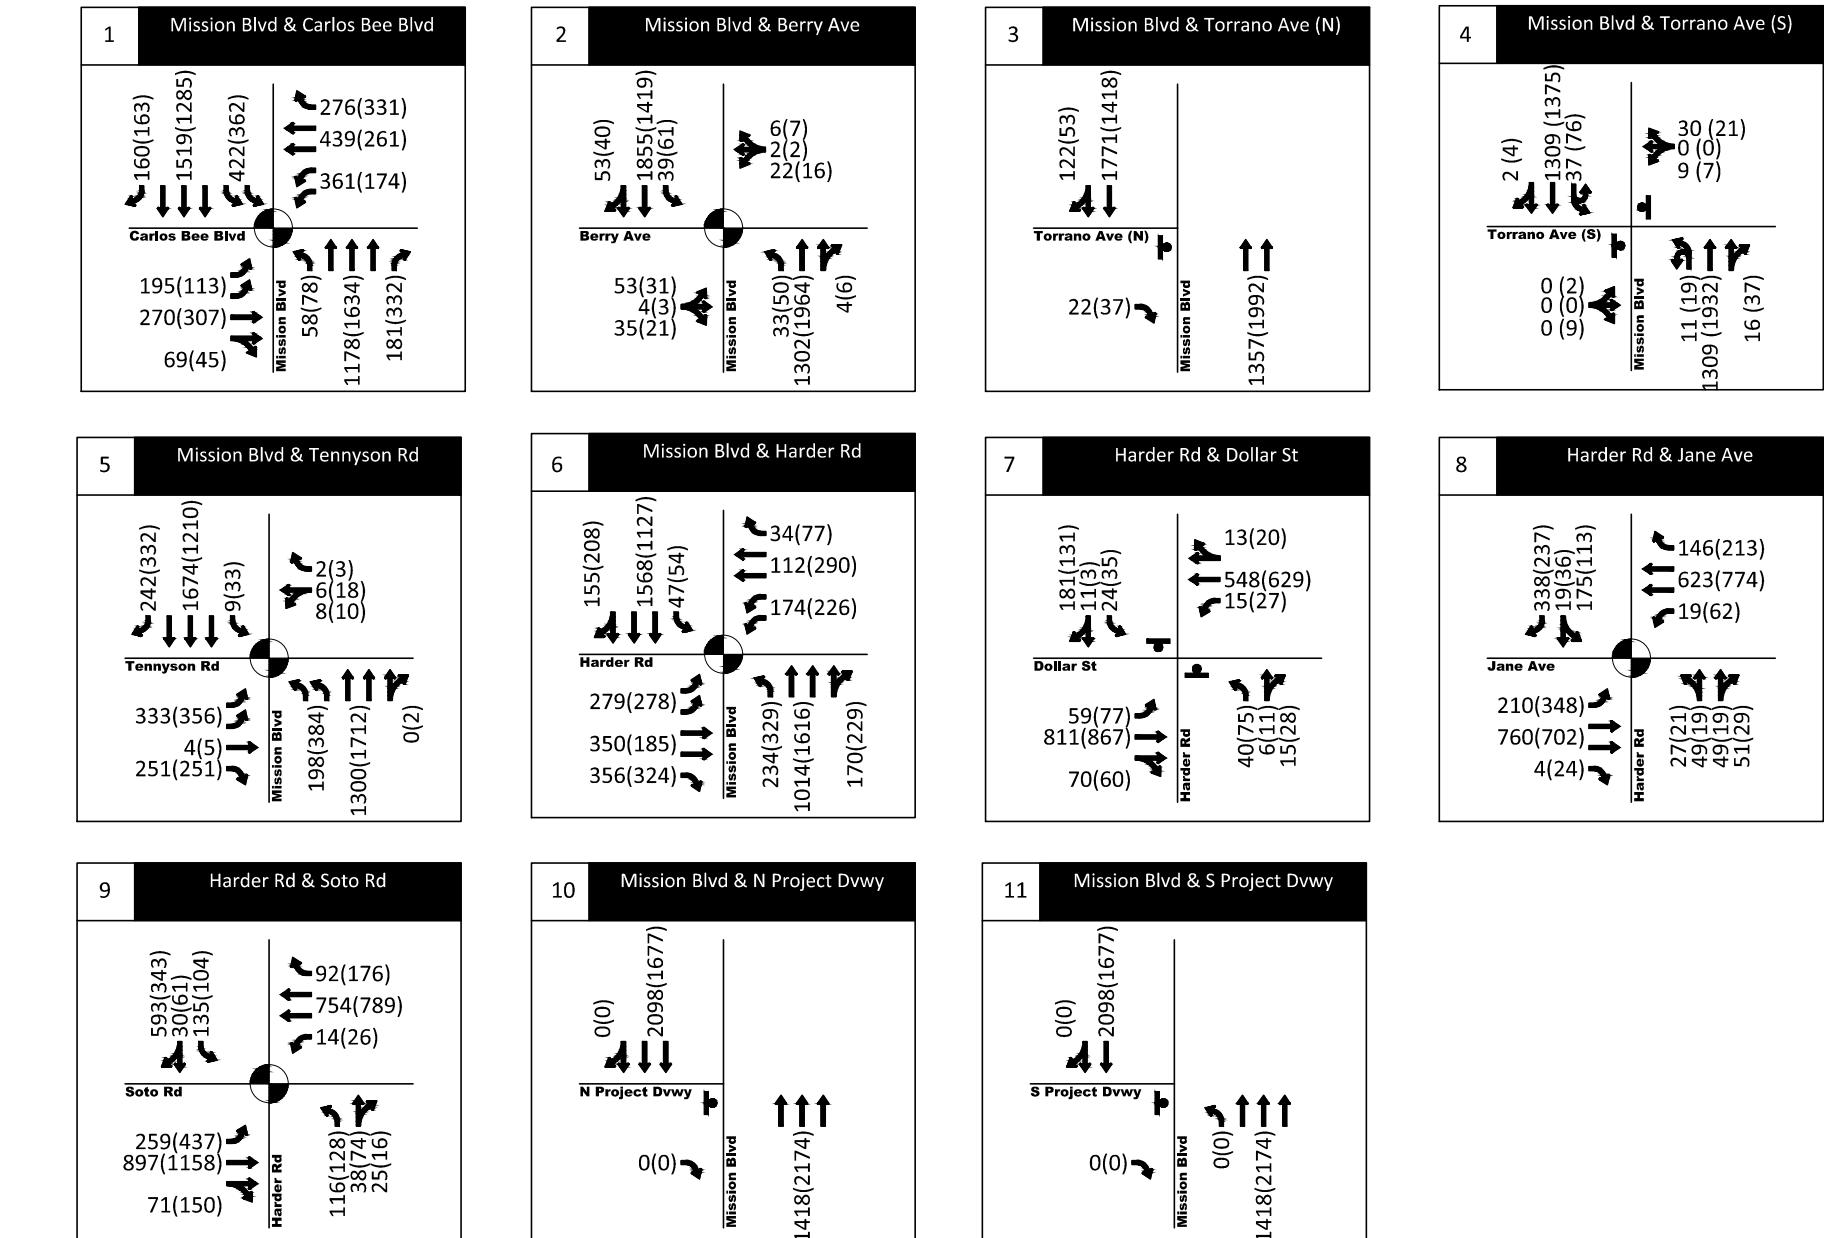

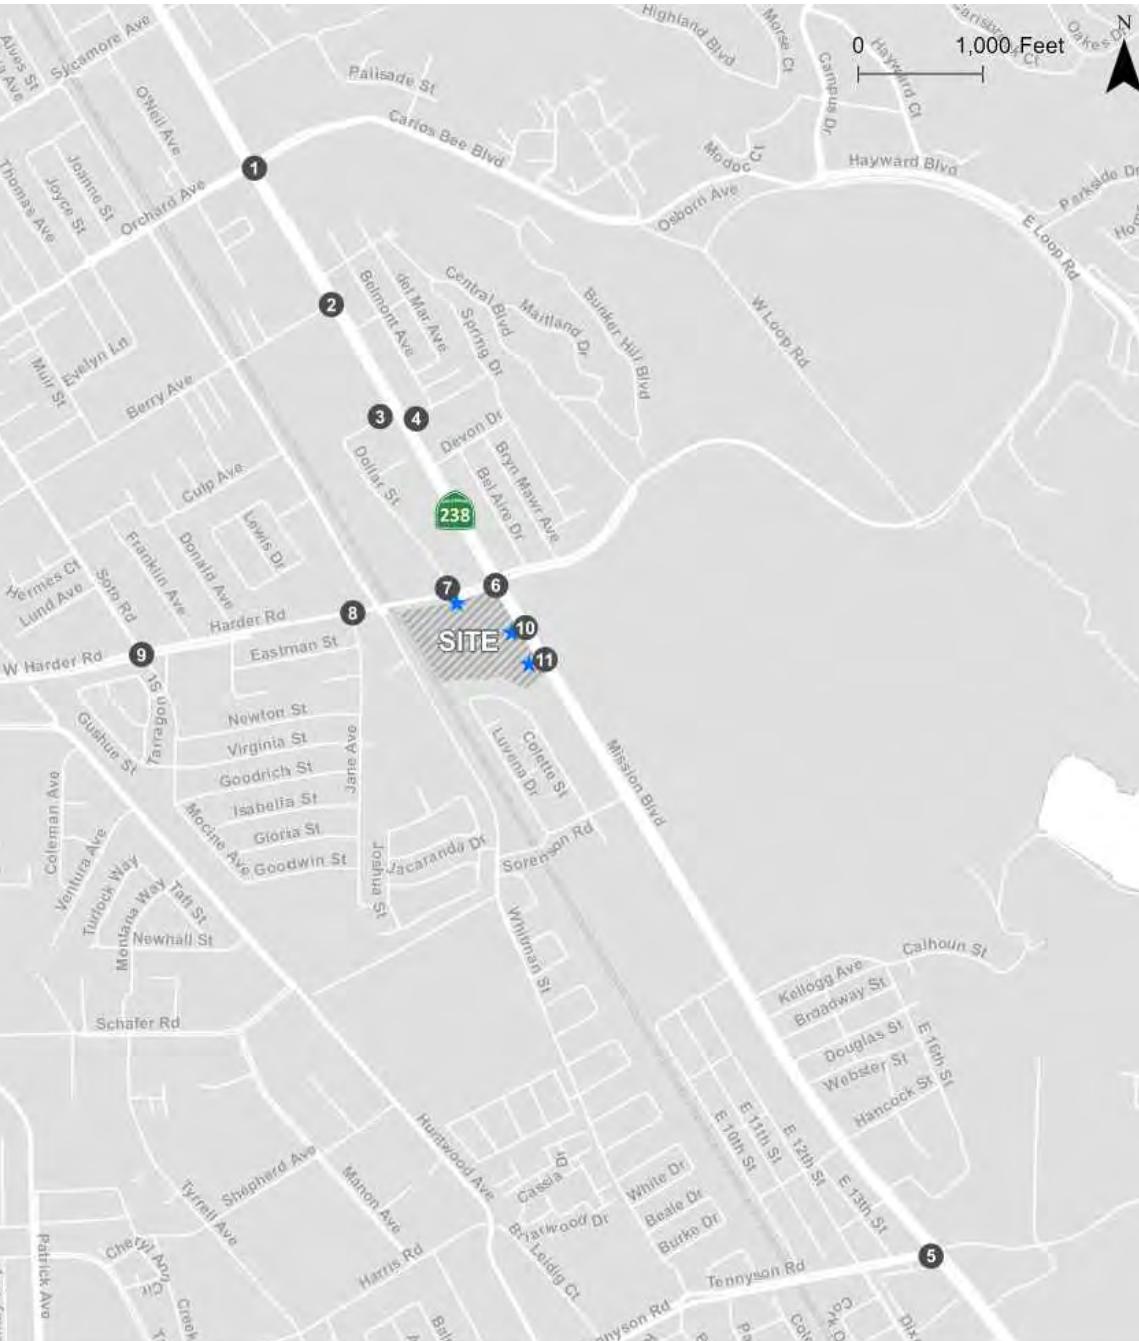

Note: KSF = thousand square feet.

A comparison of the estimated former Kmart trip numbers to the adjusted 2016 traffic counts at the Harder Road / Dollar Street intersection provides a reasonableness check for both estimates. (The south leg of the Harder Road / Dollar Street intersection is one of three driveways for the project and former Kmart site—the other two are along Mission Boulevard—and would be expected to account for a majority of the site's in and out traffic.) The adjusted 2020 volumes at the intersection (as presented in Table 7 and Table 8) show 157 in the AM peak hour (96 in, 61 out) and 204 trips in the PM peak hour (90 in, 114 out). In the PM peak hour, these numbers are within reason for what the ITE estimates provide, given that they account for a portion of project traffic. Given the Kmart site would have been more active during the PM peak hour, the AM peak hour trip patterns seem relatively high compared to ITE estimates; it is assumed that some drivers may have been using the site as a cut-through for eastbound right turn movements.

To avoid overstating the level of travel activity at the former Kmart in the adjusted 2016 and 2019 counts, it was determined that a 50 percent trip credit would be applied to project trip generation for analysis (i.e., estimate project trips would be reduced by 50 percent to develop Existing Plus Project conditions). In addition, a pass-by reduction was applied to the trip estimates (shown in Table 9). A pass-by reduction captures visitors that would normally be passing by the site on an adjacent roadway and would instead make an intermediate stop at the project site. A PM peak hour pass-by reduction of 17 percent was applied based on the ITE Trip Generation Handbook (due to the low retail activity, no pass-by reduction was applied during the AM peak hour).

As a result, the credit totaled 2,510 daily trips credited, 56 AM peak hour trips credited (39 in, 17 out), and 189 PM peak hour trips credited (95 in, 94 out).

Step 5 is presented and discussed in Section 3.1.

1.3.2 Pedestrian and Bicycle Volumes

As mentioned in section 1.3.1 above, no new traffic counts were conducted as a part of this project due to the effects of the COVID-19 pandemic. Therefore, multimodal traffic volumes available from previous counts were identified and used for the analysis. Growth factors were developed to adjust vehicular volumes to 2020 baseline. However, no sufficient information was available to identify necessary growth factors for adjusting historic pedestrian and bicycle volumes. Therefore, historic pedestrian and bicycle volumes were used without adjustments as a part of this analysis. Table 10 and Table 11 present the pedestrian and bicycle volume data used for the weekday AM and weekday PM peak hours, respectively.

1.4 PERFORMANCE

1.4.1 Traffic Signal Warrants

Traffic signal warrants are standards that provide guidelines in the determination of the need for a traffic signal.

As stated in 2020 California Revision 5 to the *Manual of Uniform Traffic Control Devices* (CA-MUTCD), “An engineering study of traffic conditions, pedestrian characteristics, and physical characteristics of the location shall be performed to determine whether installation of a traffic control signal is justified at a particular location... The investigation of the need for a traffic control signal shall include an analysis of the applicable factors contained in the following traffic signal warrants:”¹

- Warrant 1, Eight-Hour Vehicular Volume.
- Warrant 2, Four-Hour Vehicular Volume.

¹ CA-MUTCD, Section 4C.01, lines 01 and 02

- Warrant 3, Peak Hour.
- Warrant 4, Pedestrian Volume.
- Warrant 5, School Crossing.
- Warrant 6, Coordinated Signal System.
- Warrant 7, Crash Experience.
- Warrant 8, Roadway Network.

The satisfaction of a traffic signal warrant or warrants shall not in itself require the installation of a traffic control signal.

This local transportation assessment did not evaluate all warrants for traffic signals but instead focused on the peak hour warrant. The peak hour warrant is being used in this study as an indicator of the likelihood of an existing or future unsignalized intersection warranting a traffic signal. Intersections that fail to exceed the peak hour warrant are considered (for the purposes of this impact analysis) to be unlikely to meet one or more of the other signal warrants (such as the 4-hour or 8-hour warrants). However, this does not mean that a signal is definitely unwarranted. A signal may be warranted by other criteria. This peak hour analysis is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction.

As discussed in Section 1.1, the need for improvements at unsignalized intersections is based on LOS and delay, and whether any of the following are met:

- Traffic signal warrant,
- Pedestrian signal warrant, or
- All-way stop warrant.

Note that solely triggering a warrant does not trigger the need for an intersection improvement, but the City will at its discretion require or not require a signal be installed, where warranted.

Regardless of intersection control, per the City of Hayward Interim Traffic Study Guidelines (2017), improvements would be required at an intersection already operating at LOS F under an Existing or No Project scenario if the addition of project traffic results in an increase of 5.0 seconds or more in the intersection's average control delay. Unsignalized intersections were evaluated using the Peak Hour Volume Warrant (Warrant No. 3) in the CA-MUTCD. Even if the Peak Hour Volume Warrant is met, a more detailed signal warrant study is recommended before a signal is installed. The more detailed study should consider volumes during the daily peak hours of roadway traffic, pedestrian traffic, and collision histories. Table 12 presents a summary of the traffic signal warrants for the Existing Conditions scenario. Appendix 2 contains the traffic signal warrant worksheets.

As shown in Table 12, peak hour traffic signal warrants are not met in either peak hours at Mission Boulevard & Torrano Avenue (South) but are met in both peak hours at Harder Road & Dollar Street.

Table 12: Traffic Signal Peak Hour Warrants, Existing Conditions

#	Intersection	Traffic Control	Peak Hour	Warrant Met?
4	Mission Boulevard & Torrano Avenue (South)	TWSC	AM	No
			PM	No
7	Harder Road & Dollar Street	TWSC	AM	YES
			PM	YES

Based on California MUTCD (2020) Peak Hour Warrant.

Source: Kittelson & Associates, Inc. 2020

1.4.2 Automobile Level of Service

LOS at the study intersections were evaluated based on the HCM 6th Edition methodology, as implemented in the Synchro 10 software package. LOS analysis was performed for the weekday AM and PM peak hours, using traffic counts and peak hour factors as documented in Section 1.3.1. Table 13 provides a summary of the existing automobile level of service. Appendix 2 contains the Existing Conditions LOS worksheets at the study intersections.

Table 13: Automobile Level of Service, Existing Conditions

#	Intersection	Traffic Control	Weekday AM		Weekday PM	
			Delay (s)	LOS	Delay (s)	LOS
1	Mission Boulevard & Carlos Bee Boulevard	Signal	44.5	D	42.6	D
2	Mission Boulevard & Berry Avenue	Signal	15.2	B	8	A

9	Harder Road & Soto Road	Signal	>80	F	44.6	D

TWSC=two-way stop control

Source: Kittelson & Associates, Inc. 2020

As shown in Table 13, all study intersections operate within the standard (LOS E or better) under existing conditions, except for the following:

- #4 Mission Boulevard & Torrano Avenue (S):

- This intersection operates below standard at LOS F in existing weekday AM and PM peak periods. As indicated in Section 1.4.1, it does not meet the peak hour traffic signal warrant in either peak period in existing conditions.
- **#7 Harder Road & Dollar Street:**
 - This intersection operates below standard at LOS F in existing weekday AM and PM peak periods. As indicated in Section 1.4.1, it meets the peak hour traffic signal warrant in both peak periods in existing conditions.

1.4.3 Queue Storage

The 95th percentile queues at the study intersections were reviewed to identify locations where these may exceed the available storage, for informational purposes. The 95th percentile queue lengths represent queues that the top 5% longest expected to occur. This measure is typically used in traffic engineering as a conservative measure of queuing and since it only has a 5% probability of being exceeded, the average driver would likely experience shorter queue lengths than what is being reported.

For through movements and turning movements without a dedicated lane, the available storage is assumed to be the distance from the stop bar to the departure point of the nearest upstream stop-controlled or signalized intersection. For turning movements with an exclusive turn lane, the length of the turn bay is assumed to be the available storage.

Table 14 presents 95th percentile vehicle queues in excess of available storage in Existing Conditions. Appendix 2 contains Synchro queue reports, and Appendix 3 contains an intersection queue spreadsheet for all study intersections.

Table 14: Queue Lengths in Excess of Capacity, Existing Conditions

#	Intersection	Movement	Peak Hour	Spills to Adjacent Intersection?

2 PROJECT DESCRIPTION

The project site is located at 26231 Mission Boulevard at the southwest corner of Mission Boulevard and Harder Road (assessor's parcel number 452-0020-009-01). The project would entail the development of two new drive-through restaurants and a remodel of an existing 94,500 square-foot commercial building (to be partitioned into nine commercial tenants). The site is approximately 10.5 acres in size. Although the project site is currently zoned as MB-CC (Mission Boulevard – Corridor Center), the project application was submitted and deemed complete before the July 2020 adoption of the MB-CC zoning and is subject to the former South Hayward BART Form-Based Code Urban General (S-T4) and Urban Center (S-T5) zones. The project would consist of three elements:

- An approximately 3,267 square-foot new drive-through restaurant,
- An approximately 3,879 square-foot new drive-through restaurant, and
- An approximately 88,000 square-foot existing commercial building, to be remodeled and partitioned into nine tenant spaces ranging from approximately 1,800 square feet to approximately 32,100 square feet of typical retail/commercial uses.

Vehicular access to the site would be provided by three existing driveways: two on Mission Boulevard and one on Harder Road at Dollar Street. The proposed site plan is shown in Figure 8.

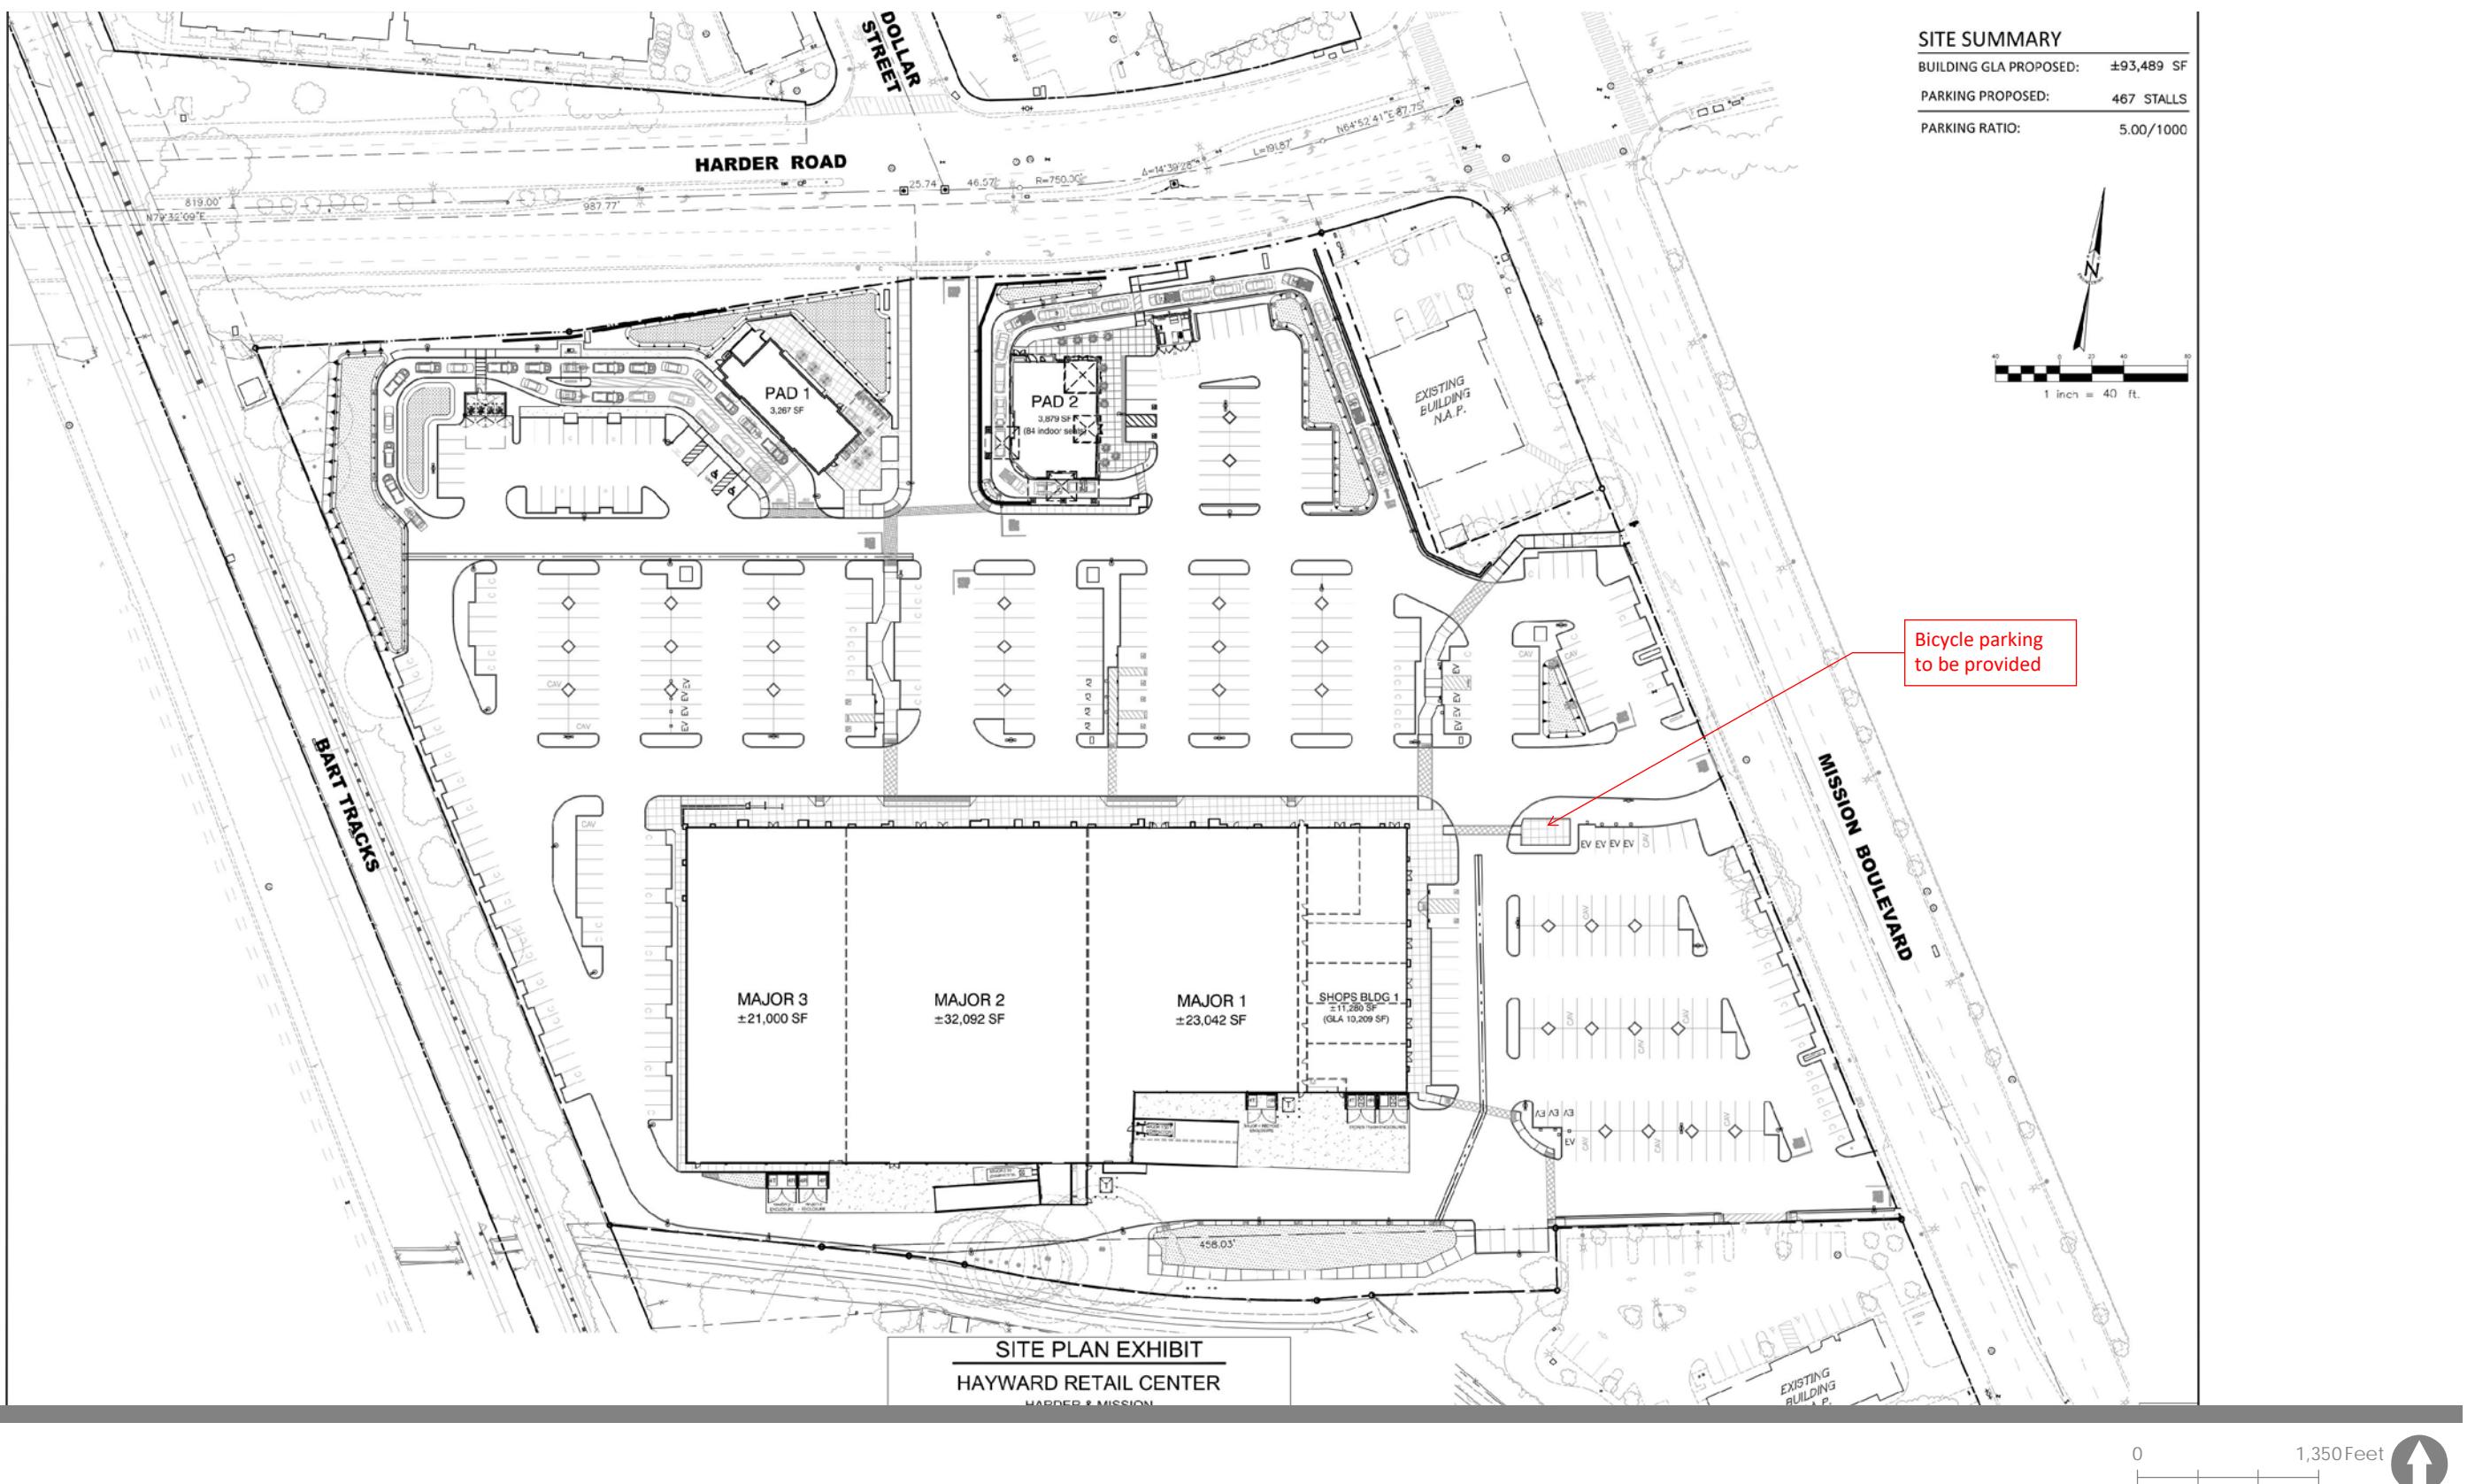

Figure 8

3 PROJECT TRIP GENERATION AND DISTRIBUTION

This section provides the vehicle trip generation and distribution estimates for the proposed project.

3.1 TRIP GENERATION

Project trip generation was estimated for the following time periods:

- Weekday daily,
- Weekday AM peak hour, and
- Weekday PM peak hour.

Trips for the proposed project were estimated using data provided by ITE and shown in Table 15. As with the former Kmart trip generation, a pass-by reduction was applied to the trip generation estimates. A pass-by reduction captures visitors that would normally be passing by the site on an adjacent roadway and would instead make an intermediate stop at the project site. The pass-by reductions were applied based on data from the ITE Trip Generation Handbook.

- For the fast-food uses, AM peak hour and PM peak hour pass-by reductions of 49 percent and 50 percent were applied, respectively.
- For the shopping center use, a PM peak hour pass-by reduction of 34 percent was applied.

The resulting net-new project trip generation estimate is given in Table 16.

Table 15: Project Trip Generation Rates

Land Use	ITE Code	Rate	Weekday Daily	Trip Generation Rates			Weekday PM Peak Hour		
				Weekday AM Peak Hour			Weekday PM Peak Hour		
				In	Out	Total	In	Out	Total

Notes: KSF signifies thousand square feet.

As shown in Table 16, with trip credits accounted for, the project is expected to generate a net total of 4,179 weekday daily vehicle trips, 170 weekday AM peak hour vehicle trips and 149 weekday PM peak hour vehicle trips. Discussion of the applicable trip credits is provided in Section 1.3.1.

3.2 TRIP DISTRIBUTION AND ASSIGNMENT

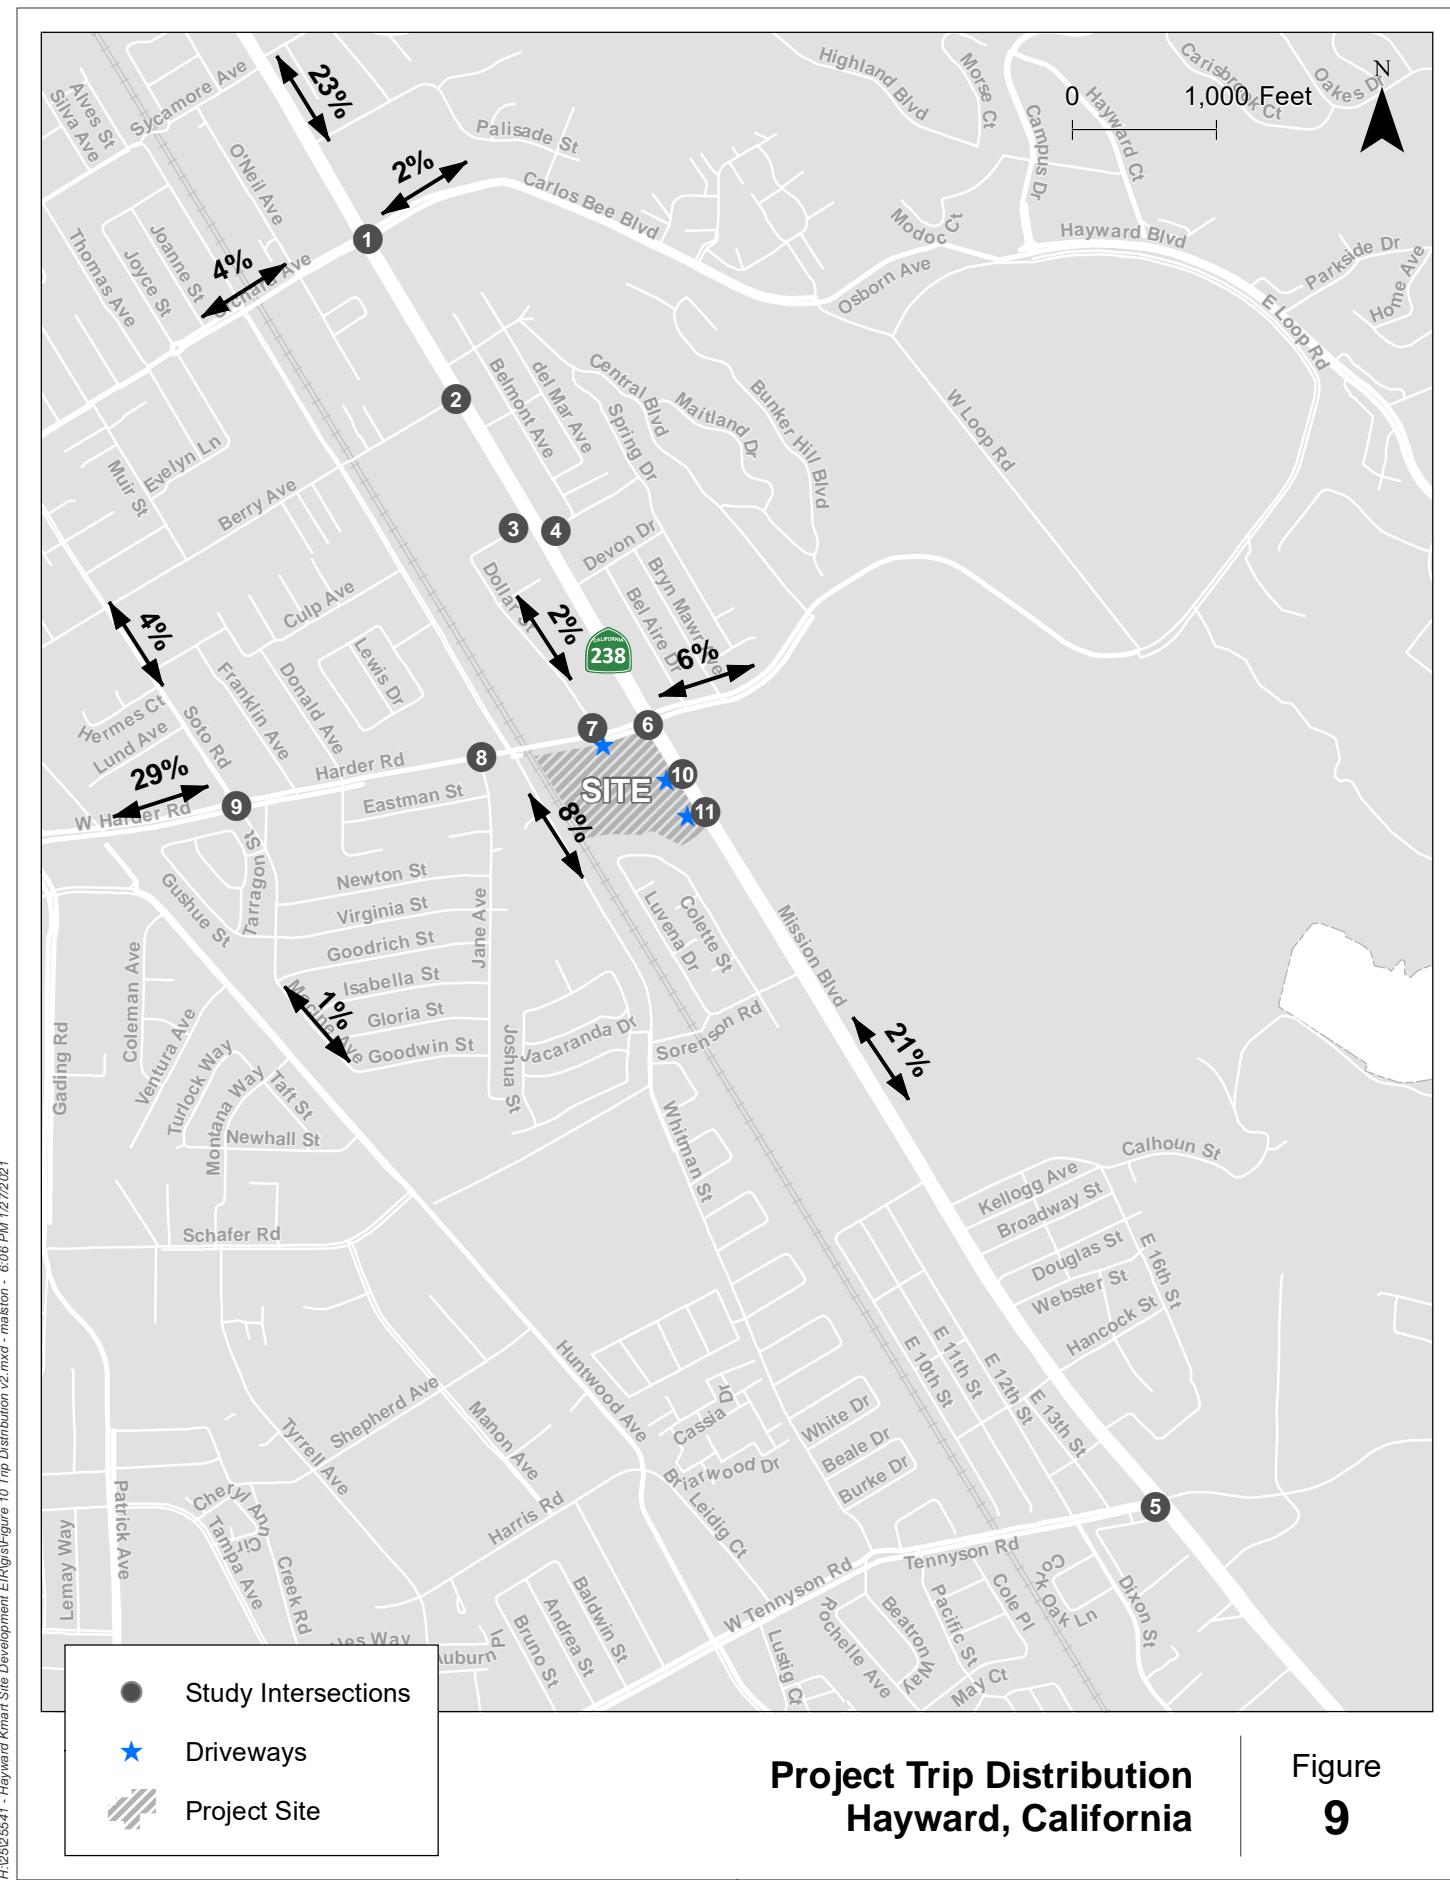

Project trip distribution was developed using the City of Hayward General Plan model that is based on a version of the Alameda CTC Countywide Model. Within the City, the model forecasts the City buildout of land uses. Outside of Hayward, the model is based on periodic updates by Alameda CTC and allows for forecast of land developments countywide. The model is periodically updated to be consistent with the most recent land use and socioeconomic database of the Association of Bay Area Governments and assumptions of the Metropolitan Transportation Commission's regional travel demand model. The project trip distribution is based on the model's distribution of trips in and out of the traffic analysis zone (TAZ) representing the project site, as well as adjustments to reflect local travel patterns and circulation conditions. Project trip distribution and study intersections are shown in Figure 9.

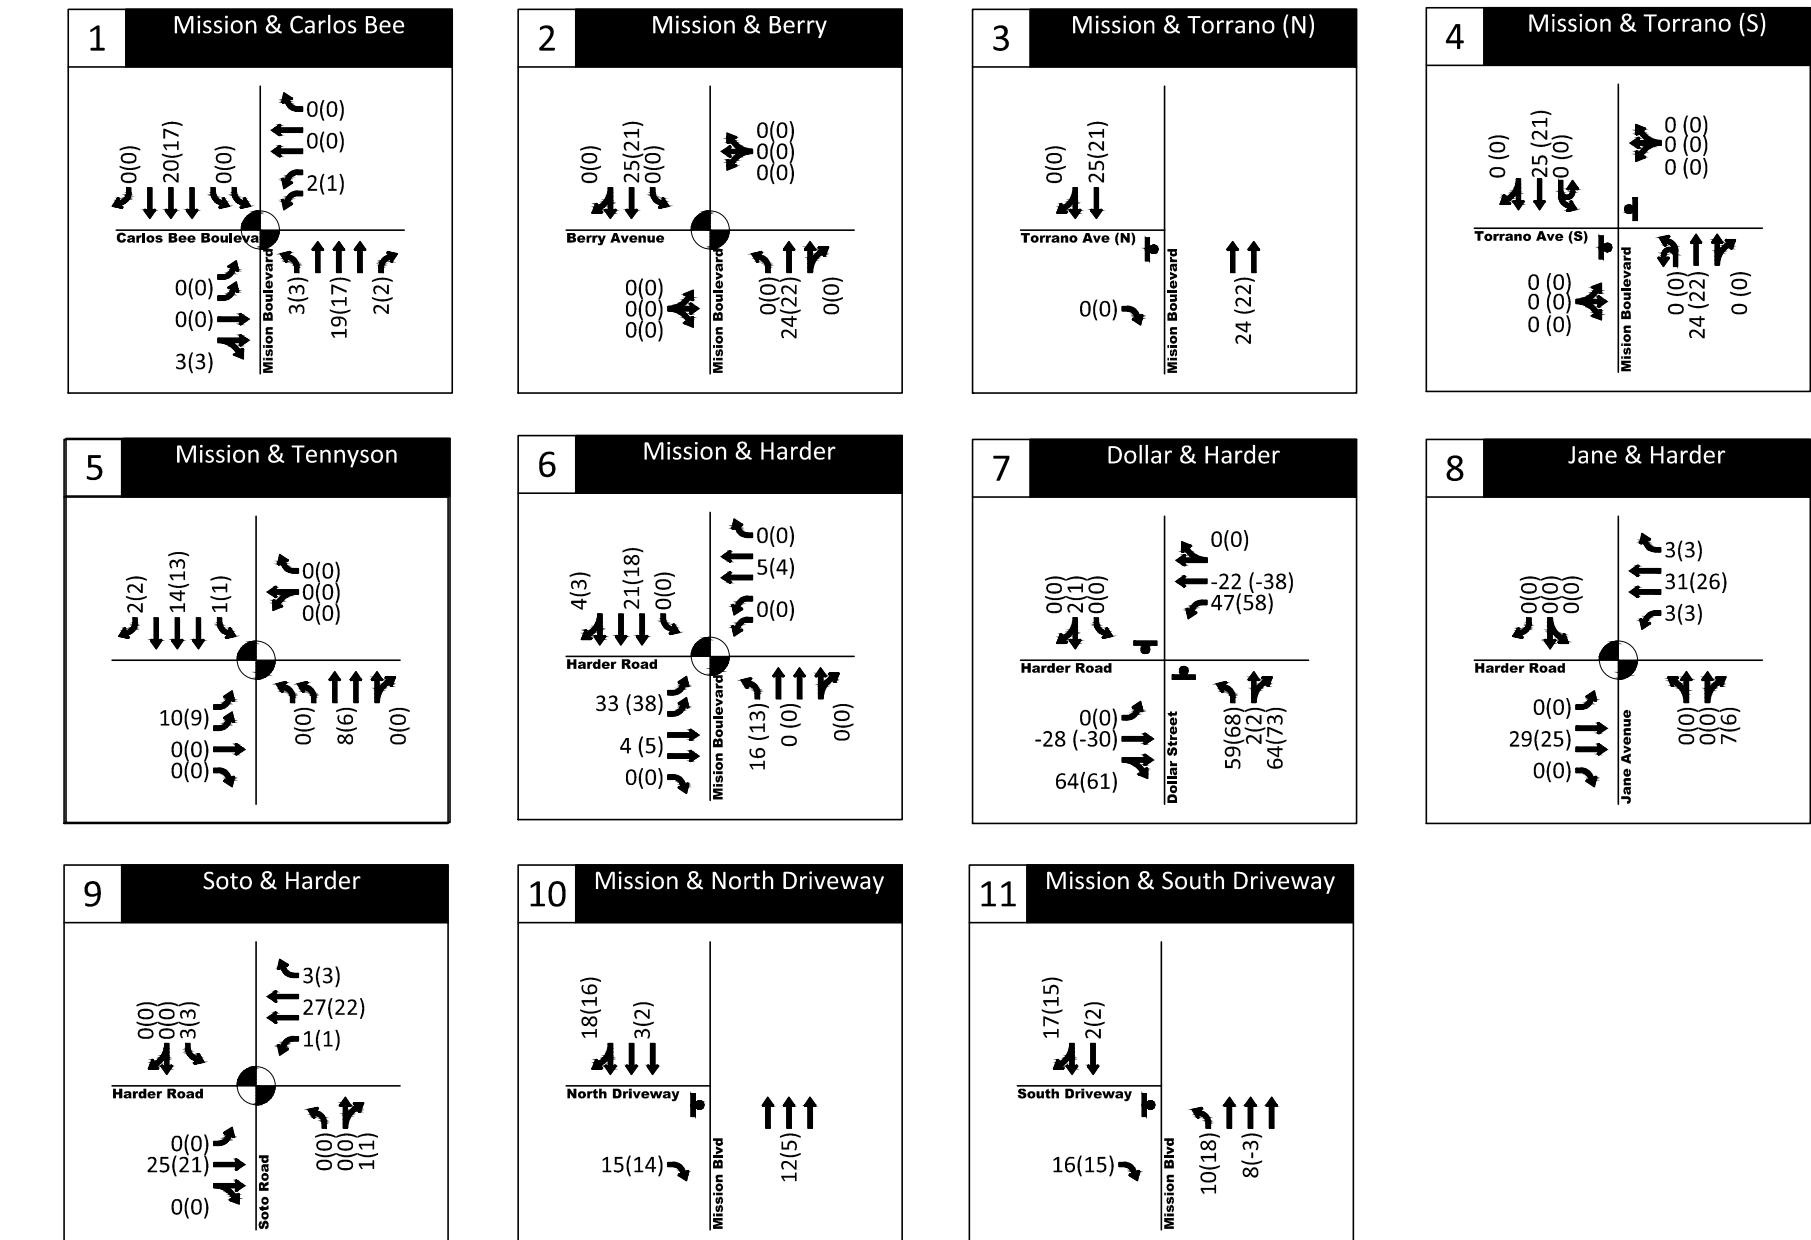

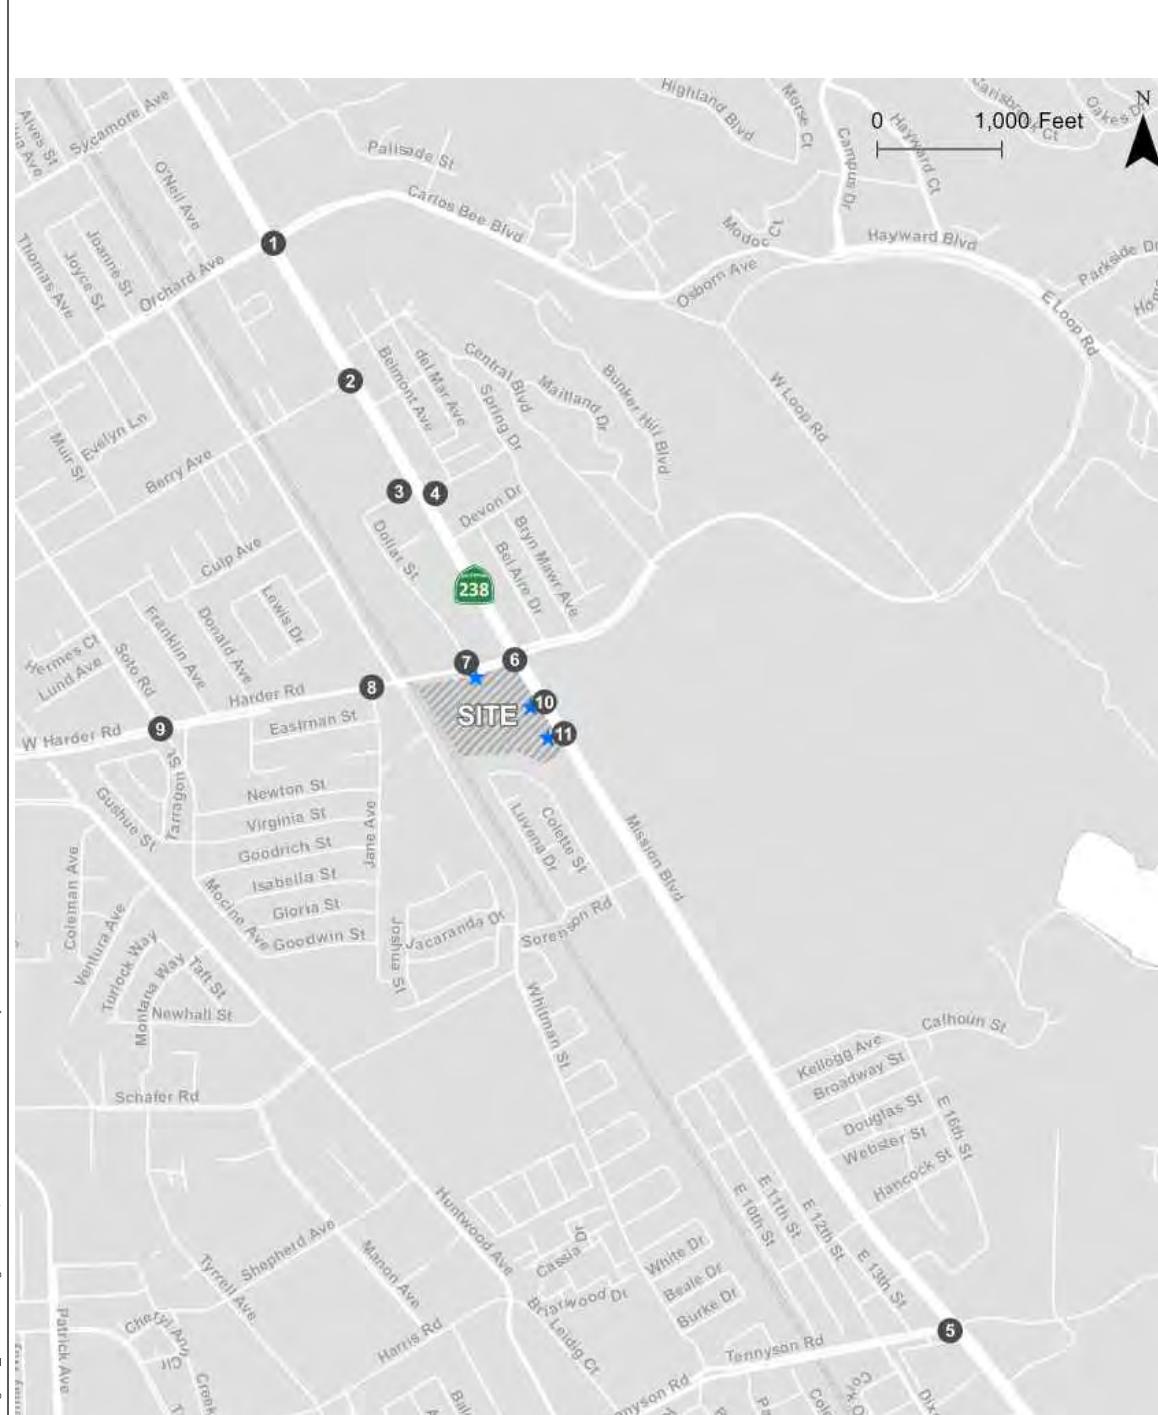

The trip distribution for the project is as follows:

- 23% to/from the north via Mission Boulevard (north of Carlos Bee Boulevard)
- 21% to/from the south via Mission (south of Harder Road)
- 2% to/from the east via Carlos Bee Boulevard
- 4% to/from the west via Orchard Avenue
- 6% to/from the east via Harder Road
- 29% to/from the west via Harder Road (west of Soto Road)
- 8% to/from the south via Whitman Street and Jane Avenue
- 4% to/from the north via Soto Road
- 2% to/from the north via Dollar Street
- 1% to/from the south via local streets

All trip distribution destinations total up to 100%.

Figure 10 presents the weekday AM and PM project-only turning movements that were derived from the trip generation and trip distribution discussed in this section. These project-only volumes are used in the Existing Plus Project and Cumulative 2040 Plus Project analyses.

4 EXISTING PLUS PROJECT TRAFFIC CONDITIONS

This chapter discusses the results of the Existing Plus Project analysis, which was conducted for non-CEQA local transportation analysis purposes. The analysis is intended to represent typical conditions, which can be expected to differ from initial opening conditions. Within the first weeks or months of project occupancy, project-related travel may either be lower than conditions described in this analysis (if the site is only partially occupied initially) or higher (if there is a “breaking in” period associated with newly available retail opportunities). Either circumstance would be expected to converge to a typical operation condition, as described in this section.

4.1 EXISTING PLUS PROJECT AUTOMOBILE LEVEL OF SERVICE

The automobile turning movement counts for the Existing Plus Project scenario were developed from the sum of the Existing Conditions turning movement counts and the project-only turning movements described above (and displayed in Figure 10). Figure 11 presents the Existing Plus Project turning movements.

Table 17 presents the Existing Conditions and Existing Plus Project delays and LOS for the study intersections. The table also compares the change in delay between the two scenarios. Appendix 4 contains the Existing Plus Project LOS worksheets. Intersection delay slightly decreases at one signalized intersection with the addition of project trips because an addition of trips to a movement with relatively low delay actually decreases the average intersection delay overall.

Table 17: Automobile Level of Service, Existing Plus Project Conditions

#	Intersection	Control	Peak Hour	Existing		Existing Plus Project		Delay Delta (s/veh)
				Delay (s/veh)	LOS	Delay (s/veh)	LOS	
1	Mission Boulevard & Carlos Bee Boulevard / Orchard Avenue	Signal	AM	44.5	D	44.7	D	0.2

Bold indicates intersection operating below LOS standard. **Shading** indicates intersection improvement required.

Source: Kittelson & Associates, Inc. 2021.

As shown in Table 17, the following intersections either degrade to below LOS standard with the addition of project trips or, if already operating below the LOS standard, incur at least 5 seconds of additional average control delay with the addition of project trips:

- **#4 Mission Boulevard & Torrano Avenue (South):** This intersection continues to operate below the LOS standard, with an LOS F and more than 5 seconds of additional average control delay with the addition of project trips in the weekday AM and PM peak hours.² However, the intersection does not meet the peak hour signal warrant under Existing Plus Project conditions (see Table 18 and Appendix 4). Therefore, potential improvements other than a traffic signal are discussed below.

² The full LOS worksheets and reports are provided in Appendix 4. The static outputs show an increase in AM peak hour delay with the addition of project trips. Due to the level of intersection oversaturation, the results do not show an increase with the addition of project trips in the PM peak hour. The volume input parameters appear to be outside the bounds of Synchro's implementation of Highway Capacity Manual methodologies. However, because additional delay in relation to traffic volumes is exponential in nature, it was judged that the addition of project trips would likely add more than five seconds of additional delay to the worst movement at the project intersection.

An option explored in both the AM and PM peak hours was to restripe the westbound and eastbound approaches to separate left-turn movements from right and through movements. In both cases, this solution reduced the side-street average control delays to pre-project levels. However, the eastbound approach to the intersection is a commercial parking driveway without sufficient room for such restriping. The intersection would still operate below the City's LOS standard, and the peak hour signal warrants would not be met in either the AM or PM peak hour. Because the side-street volumes are relatively low and there may be other considerations at this intersection (i.e., safety considerations and design vehicle movements related to lane widths), no modifications are recommended at this location.

- **#7 Harder Road & Dollar Street:** This intersection continues to operate below the LOS standard, with an LOS F and more than 5 seconds of additional average control delay with the addition of project trips in the weekday AM and PM peak hours. The intersection meets the peak hour signal warrant under Existing and Existing Plus Project conditions (see Table 18 and Appendix 4). Therefore, intersection improvements should be identified.

It is recommended that a traffic signal be installed at this location. With signalization, the intersection would operate within the standard. Modeled with a traffic signal and a protected/permissive northbound left-turn phase, the intersection operates within City LOS standards in the weekday PM peak hour.³ Since the project results in operational deficiencies under the Existing Plus Project scenario and this intersection serves as a primary access driveway for the Project, the project's fair share contribution toward improvements is 100%.

Two other options were preliminarily considered at this location. One was a roundabout, which generally provides safety benefits and provides capacity benefits relative to all-way stop controls and comparable with some traffic signals. *NCHRP Report 672: Roundabouts – An Informational Guide* (NCHRP Report 672) provides planning-level information regarding roundabout lane and size requirements. Exhibit 6-9 in NCHRP Report 642 provides typical inscribed circle diameter ranges for roundabouts depending on the intersection design vehicle. Given that Harder Road is a local truck route and would be expected to serve WB-50 or WB-67 vehicles, Exhibit 6-9 indicates that a single-lane inscribed circle diameter range could be expected to be between 130 to 180 feet just to the edge of the vehicle traveled way.⁴ Irrespective of approach treatments to achieve proper speed control and considering proximity to the Mission Boulevard & Harder Road

³ See supplementary memorandum included in Appendix 8 for more details.

⁴ Hayward Truck Route information obtained from <https://www.hayward-ca.gov/police-department/truck-routes-and-transportation-permits>

intersection, the expected right-of-way requirements of a roundabout at this location make it an infeasible improvement option.

The other option analyzed at this location was prohibition of turning movements: prohibiting left-turn and through movements from the project site and from Dollar Street into the project would reduce the delay at the intersection and reduce the potential for vehicle conflicts. However, prohibiting those movements would limit accessibility to and from the site and increase circuitry on the transportation network. For example, outbound project visitors with destinations west or north of the project site would need to travel out-of-direction and find U-turn opportunities, straining the roadway network. As a result, the signal option was recommended for more detailed assessment.

- Signalization of this intersection would provide other benefits. As noted in Section 1.2.3, pedestrian crossing opportunities along Harder Road are limited to signalized intersections and one improved crossing at Franklin Avenue. Signalization of this intersection would provide an additional controlled pedestrian crossing of Harder Road (current crossing opportunities at Mission Boulevard and at Jane Street are approximately 1,100 feet apart) and would improve pedestrian access to and from the project site. A signal would also provide dedicated phases for controlled access into and out of the project site, including northbound drivers and westbound left-turning drivers who would otherwise need to identify gaps in traffic. Further analysis was conducted to assess the feasibility and refine the details of the intersection and signal design, given the proximity to Mission Boulevard and the possibility of queueing propagating from one intersection to another. The analysis determined that a signal is feasible. The analysis memo includes a recommendation to connect the Harder/Dollar signal controller to the existing SCATS coordinated system at Mission/Harder. Per City staff advisement, coordination would also require connecting the controller at Harder Road & Jane Avenue to the system. This connection along Harder Road from Mission Boulevard to Jane Avenue would create a larger coordinated system that would adjust signal cycles dynamically to maintain smooth traffic flow through the new traffic signal at Harder Road/Dollar Street while allowing phasing to be responsive to future traffic demands.
- Recommendations are discussed in more detail in the memorandum included in Appendix 8 and are summarized in Section 9 of this report.

LOS and queue report worksheets for the signalized improvement are included in Appendix 4.

Table 18: Traffic Signal Peak Hour Warrants, Existing Plus Project Conditions

#	Intersection	Traffic Control	Peak Hour	Warrant Met?
4	Mission Boulevard & Torrano Avenue (South)	TWSC	AM	No
			PM	No

7	Harder Road & Dollar Street	TWSC	AM	Yes
			PM	Yes

Based on California MUTCD (2020) Peak Hour Warrant.

Source: Kittelson & Associates, Inc. 2021.

4.2 EXISTING PLUS PROJECT QUEUE STORAGE

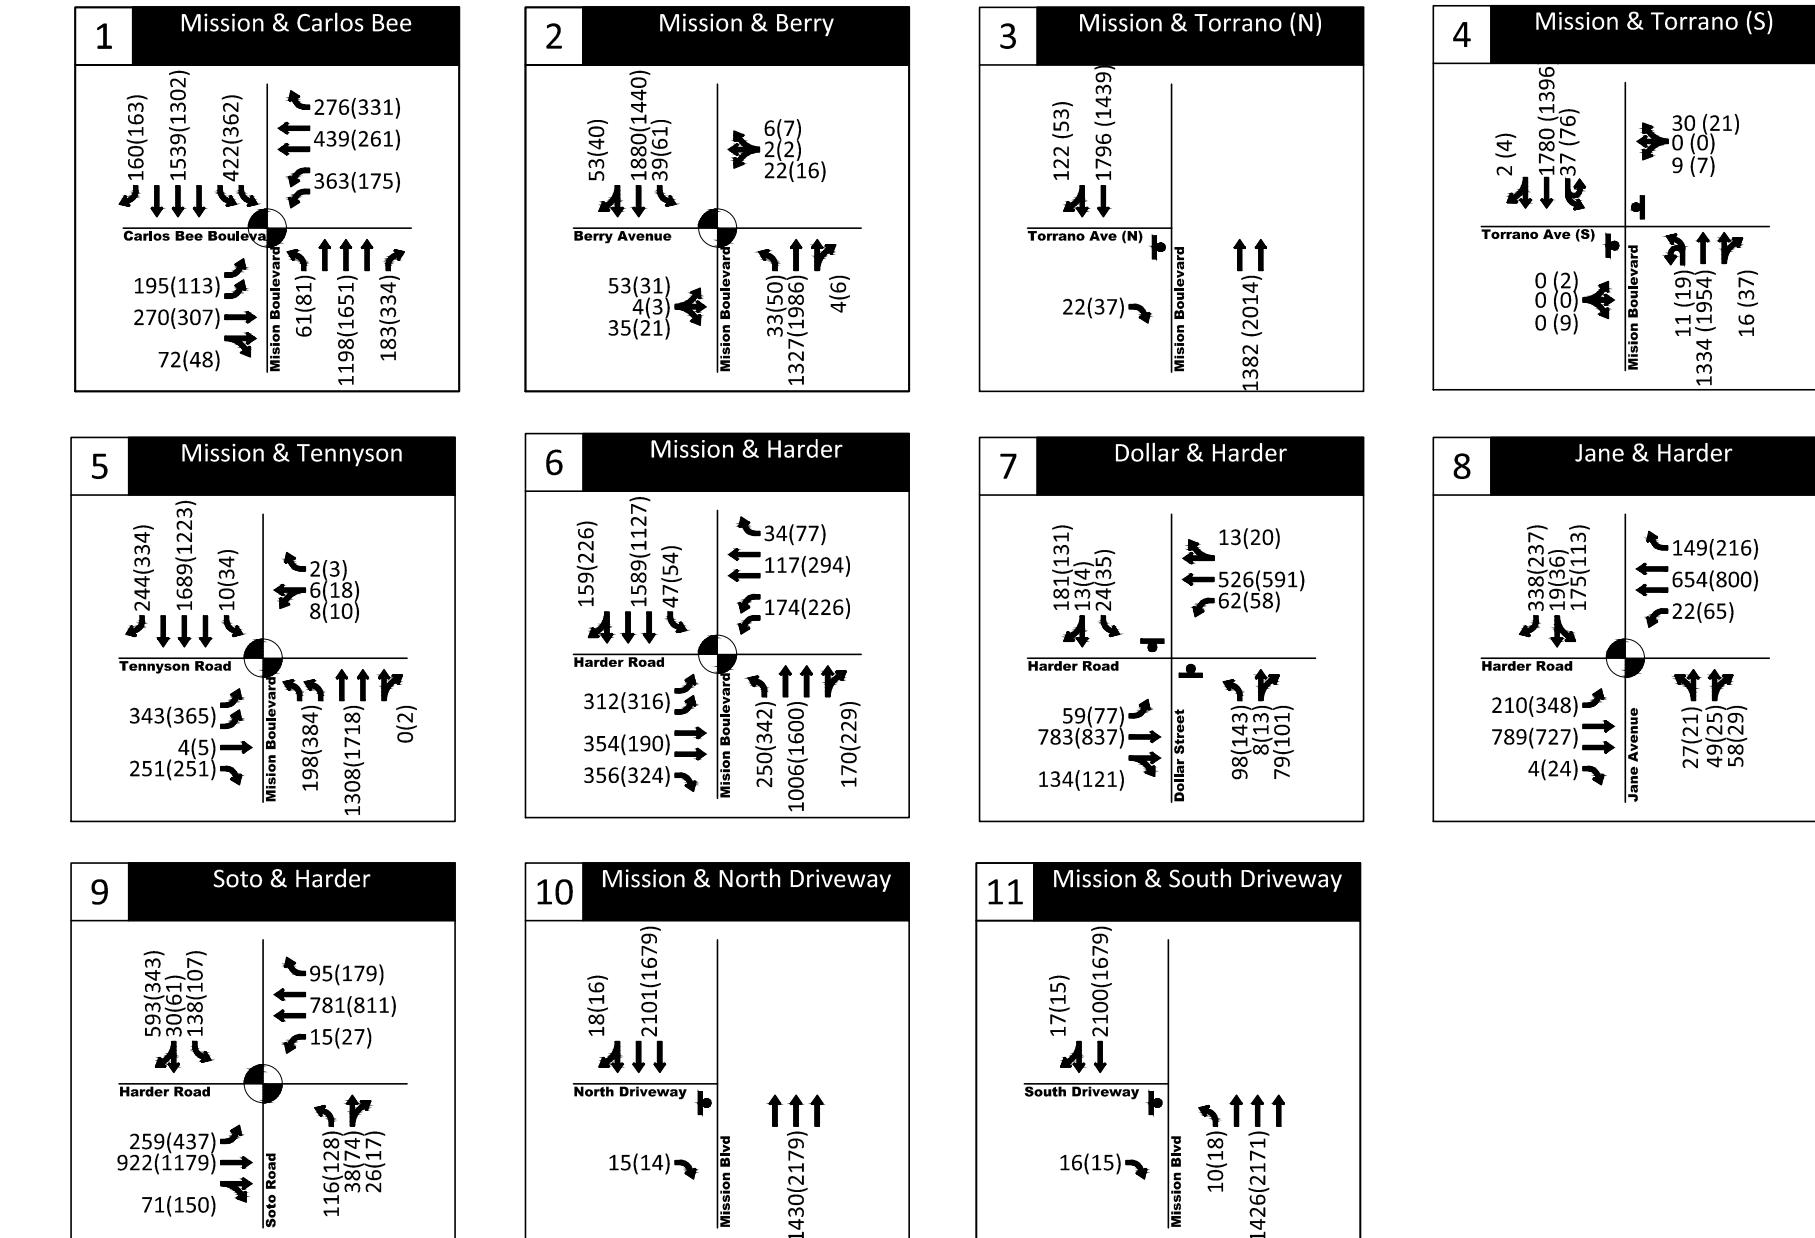

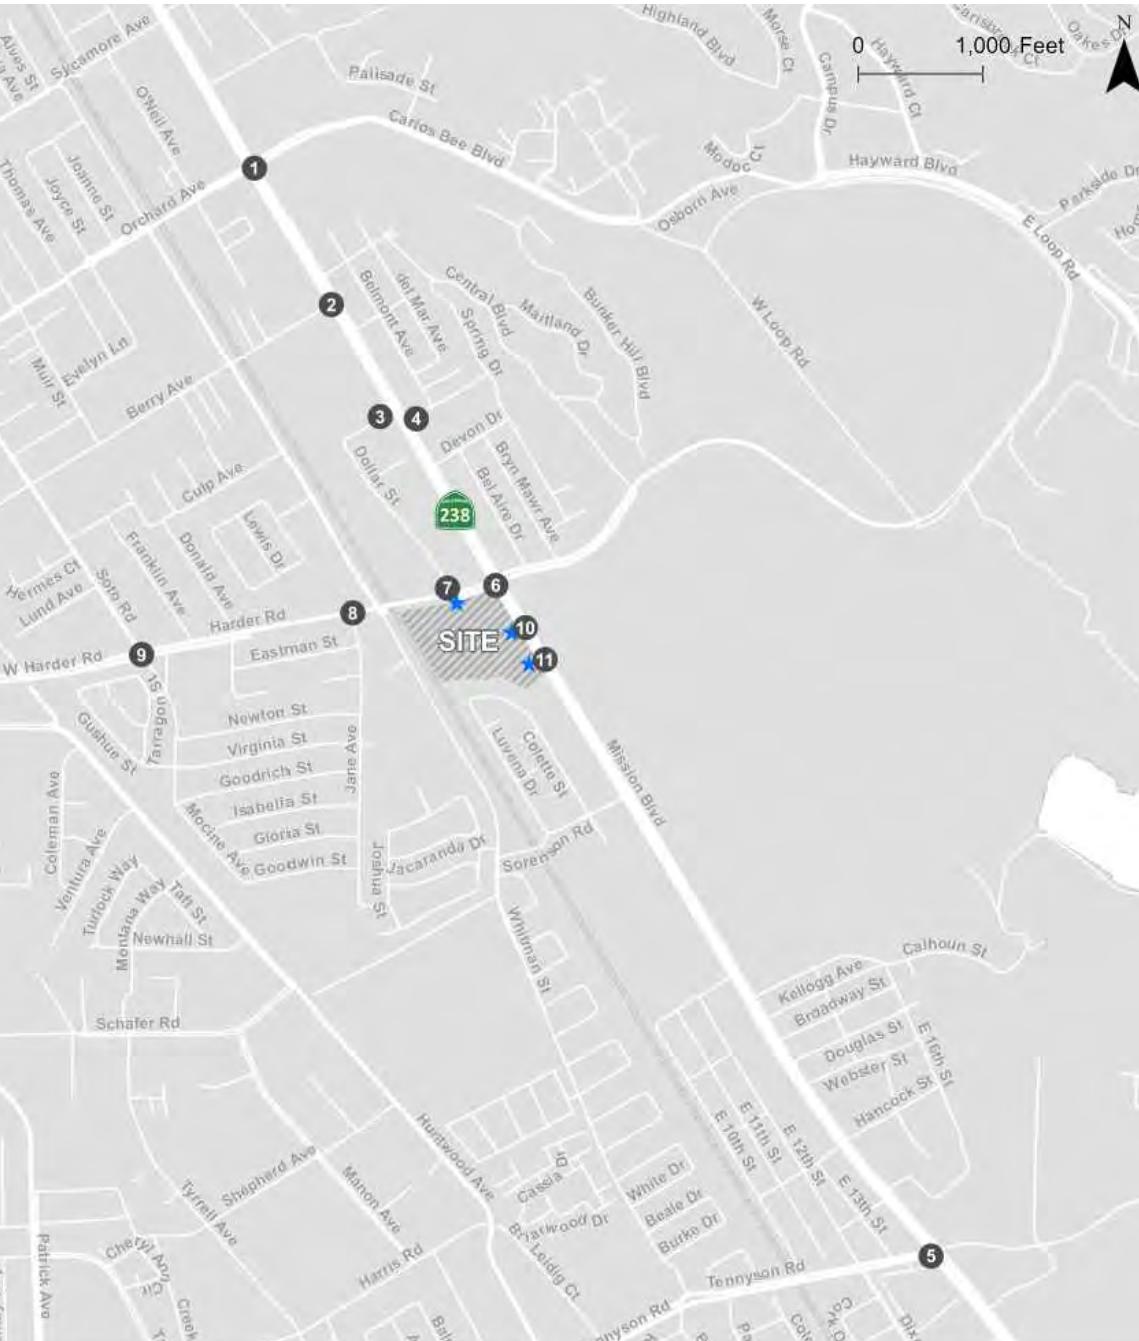

Table 19 presents 95th percentile vehicle queues in excess of available storage in Existing Plus Project Conditions. Appendix 4 contains Synchro queue reports, and Appendix 3 contains an intersection queue spreadsheet for all study intersections.

Table 19: Queue Lengths in Excess of Capacity, Existing Plus Project Conditions

#	Intersection / Movement	Peak Hour	Did Queue Exceed Storage in No Project Condition? (Yes/No)	Spills to Adjacent Intersection?	Increase in Queue with Addition of Project Trips
1	Mission Boulevard & Carlos Bee Boulevard	WBL	AM	Yes	No 1 foot (less than 1 car length)
2	Mission Boulevard & Berry Avenue	NBT/R	PM	Yes	No 12 feet (less than 1 car length)
6	Mission Boulevard & Harder Road	EBL	AM & PM	Yes	No AM: 20 feet (1 car length) PM: 21 feet (1 car length)
7	Harder Road & Dollar Street	NBL	AM & PM	No	Yes AM: 233 feet (9 car lengths) PM: 248 feet (10 car lengths)
8	Harder Road & Jane Avenue	EBL	AM & PM	Yes	No AM: 0 feet PM: 0 feet
9	Harder Road & Soto Road	NBL	AM & PM	Yes	No 0 feet
		EBL	PM	Yes	No 0 feet
		WBT	AM & PM	Yes	Yes AM: 25 feet (1 car length) PM: 19 feet (1 car length)

Source: Kittelson & Associates, 2021.

As shown in Table 19, the addition of project trips is not expected to contribute more than one car length to existing queues at study intersections that extend beyond available capacity, with the exception of the northbound approach at Harder Road & Dollar Street. Because that intersection serves as a primary driveway access for the project site, northbound intersection approach queues would be accommodated on the project site rather than in the public right-of-way.

5 CUMULATIVE 2040 PLUS PROJECT CONDITIONS

The potential operational deficiencies to the transportation system were evaluated under the Cumulative Year 2040 Condition for non-CEQA local transportation analysis purposes. Intersection operations were evaluated using projected peak hour traffic volumes derived from the Hayward General Plan Update version of the Alameda CTC Countywide Model.

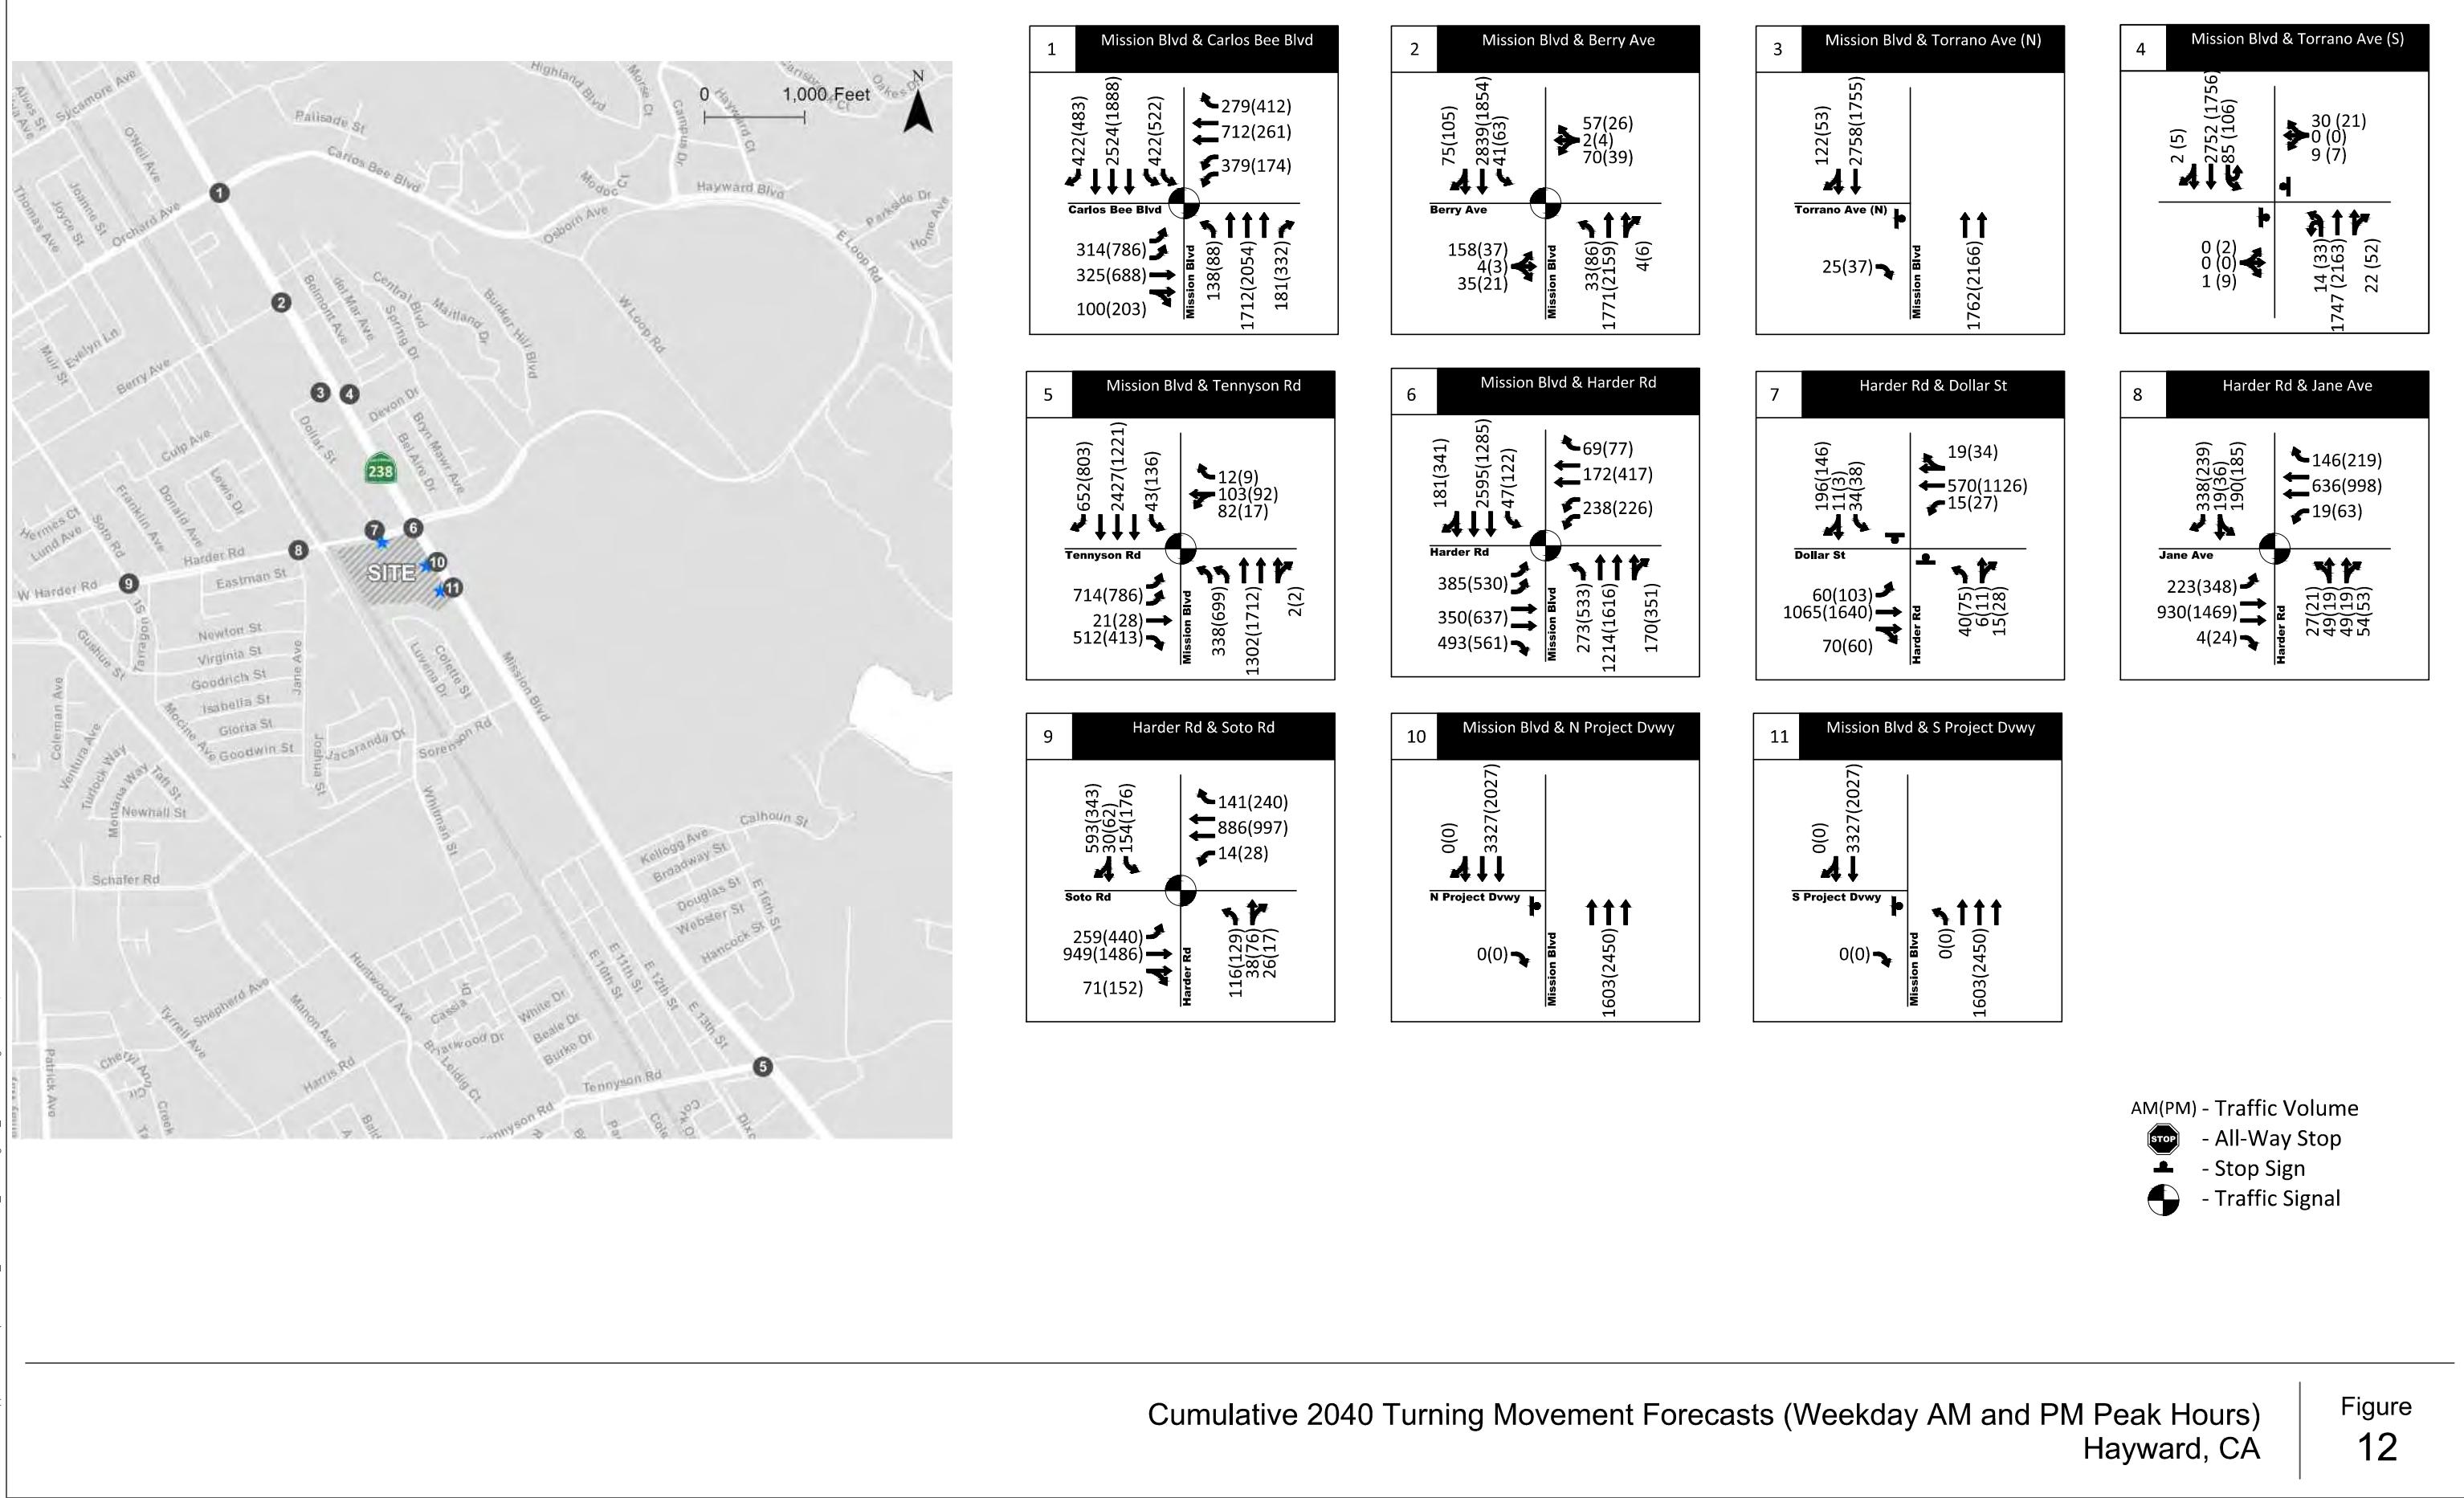

5.1 DEVELOPMENT OF CUMULATIVE 2040 DEMAND

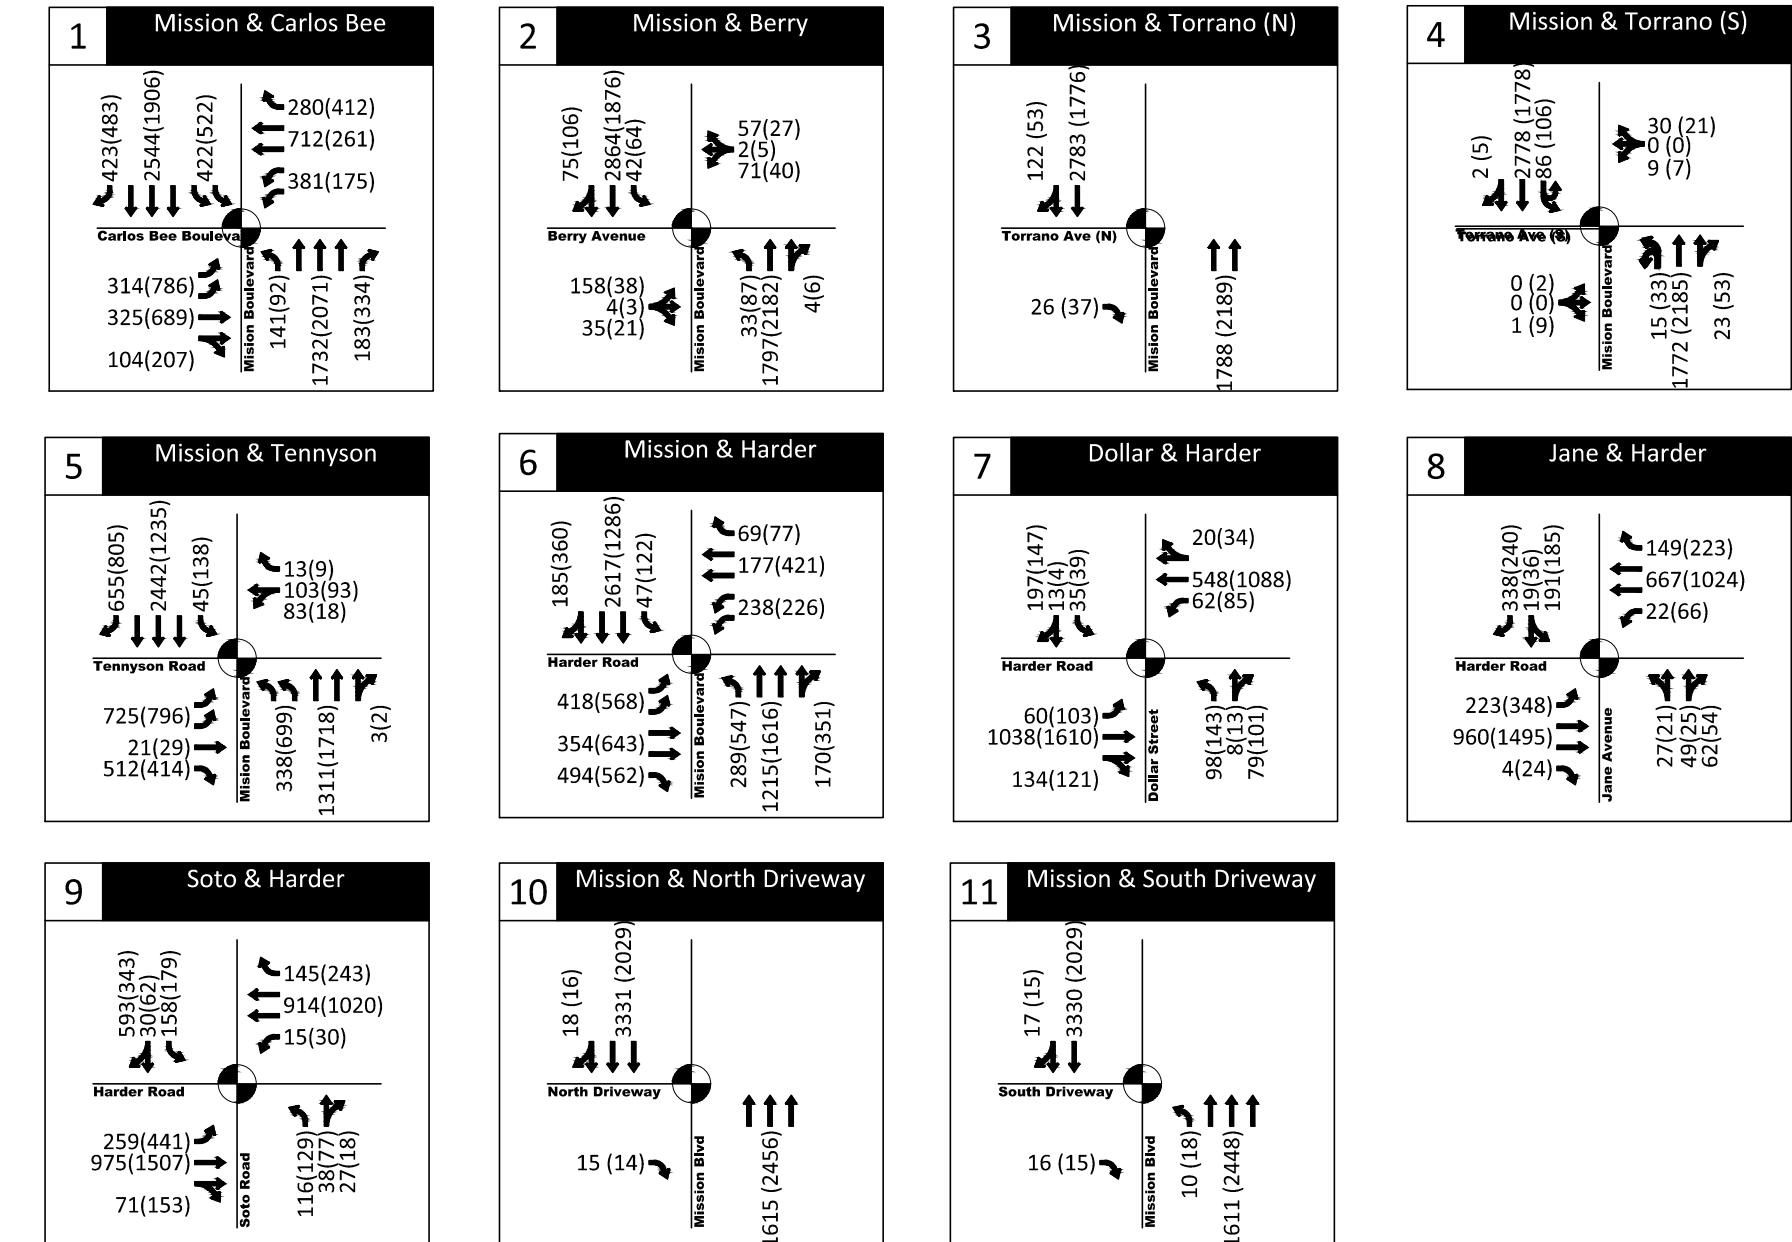

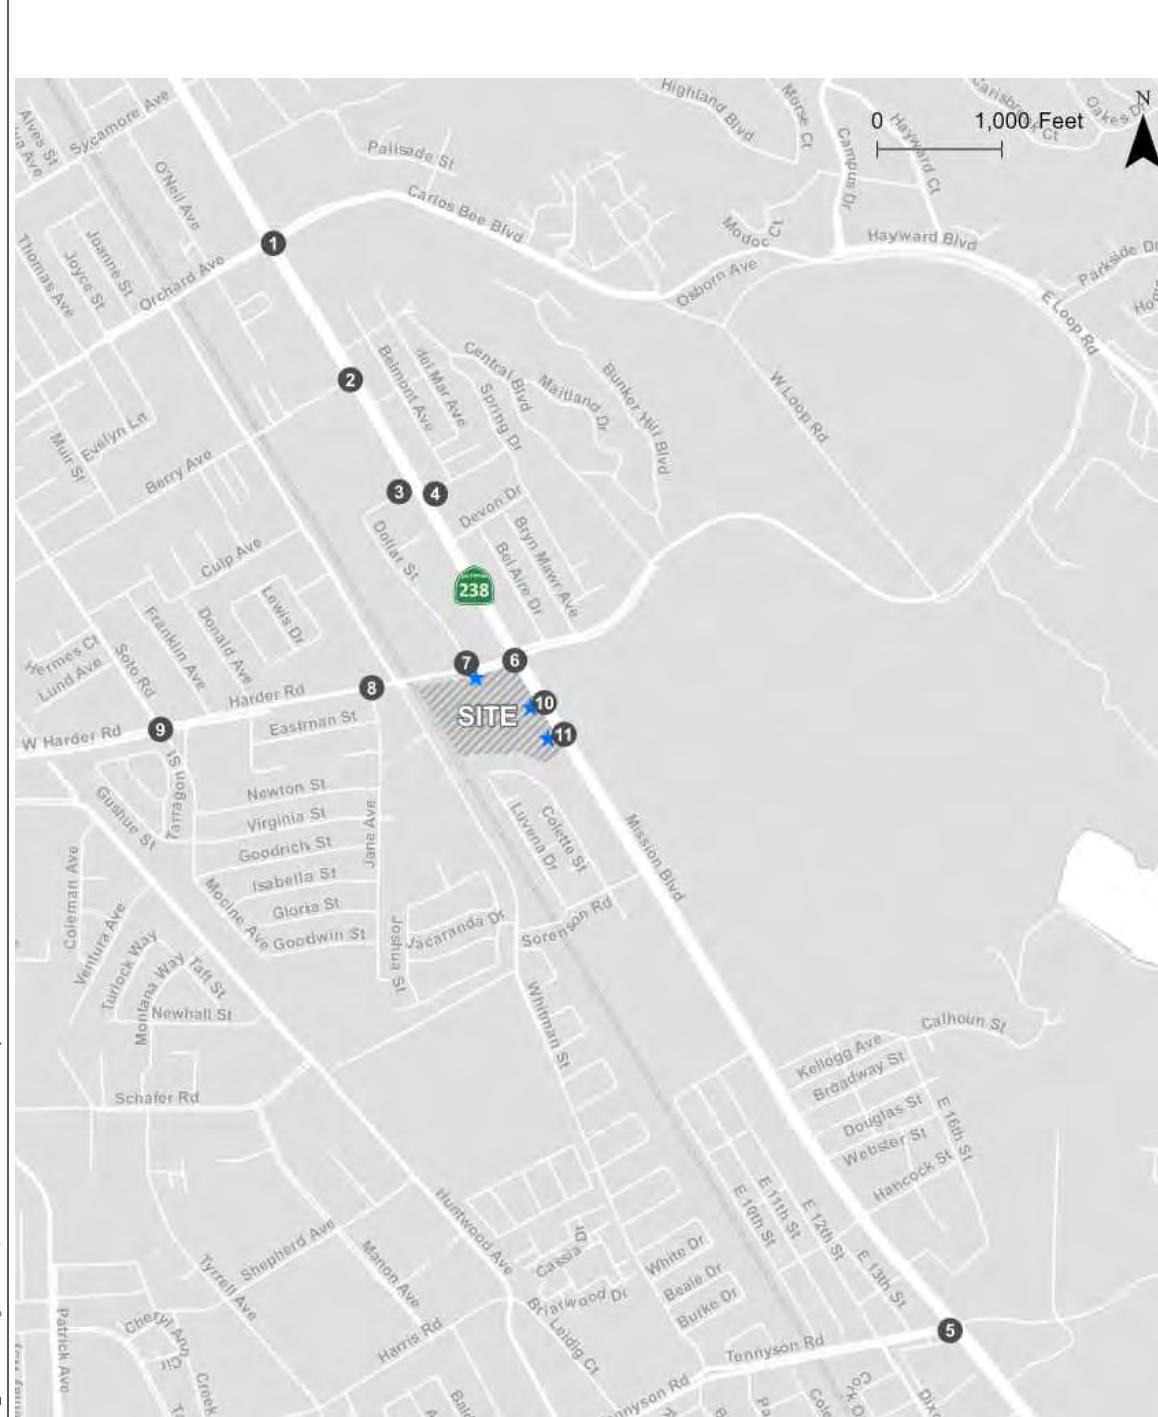

The model includes future development throughout the region. The 2035 forecasts are consistent with regional totals for growth projected by ABAG in their Projections 2009 report. Cumulative No-Project volumes were extracted from the travel model and adjusted based on the incremental or difference method described in NCHRP 255⁵ methods, consistent with the methodology used for the Hayward General Plan and other citywide Specific Plans. The method compares future year model volumes to existing year model volumes to identify the growth increment, and then adds this increment to the existing counts, thus smoothing out any model validation error compared to existing counts. When new roadway facilities are introduced, in some cases traffic growth would be allowed to reduce below existing count levels for some turn movements. In this case, there are no significant new roadway facilities in the immediate study area, so the incremental adjustment method did not produce negative traffic growth. To be consistent with the ABAG growth projections at 2040 levels and to align with the timing of the Hayward General Plan buildout, Kittelson extrapolated the 2035 turning movement volumes to 2040 by projecting the same growth out for five additional years.

Therefore, the traffic forecasts reflect traffic from growth in Hayward as well as traffic from future developments in the region that may use the local roadways.

The automobile turning movement counts for the Cumulative 2040 scenario are displayed in Figure 12.

5.2 CUMULATIVE 2040 PLUS PROJECT AUTOMOBILE LEVEL OF SERVICE

Cumulative Plus Project scenario were developed from the sum of the Cumulative 2040 No Project volumes and the project-only turning movements. The Cumulative 2040 No Project volumes are presented in Figure 12. Project-only volume development is described in Section 3, and the volumes are shown in Figure 10. Cumulative 2040 Plus Project volumes are shown in Figure 13.

Table 20 presents the Cumulative 2040 and Cumulative 2040 Plus Project delays and LOS for the study intersections. The table also compares the change in delay between the two scenarios. Appendix 5 and Appendix 6 contain the LOS worksheets, queueing reports, and peak hour signal warrant analyses for these scenarios.

Source: Kittelson & Associates, Inc. 2020

Bold indicates intersection operating below LOS standard. **Shading** indicates intersection improvement required.

As shown in Table 20, the following intersection is already operating below the LOS standard and incurs at least 5 seconds of additional average control delay with the addition of project trips:

- **#4 Mission Boulevard & Torrano Avenue (South):** This intersection continues to operate below the LOS standard, with an LOS F and more than 5 seconds of additional average control delay with the addition of project trips in the weekday AM and PM peak hours.⁶ However, the intersection does not meet the peak hour signal warrant under Cumulative Plus Project conditions (see Table 21 and Appendix 5). Therefore, potential improvements other than a traffic signal are discussed below.

An option explored in both the AM and PM peak hours was to restripe the westbound and eastbound approaches to separate left-turn movements from right and through movements. In both cases, the delay is not shown to decrease appreciably with the restriping. Another option would be to prohibit left turns and through movements from the side-street approaches, requiring drivers to make a right turn and continue along Mission Boulevard to make a U-turn when available. This change would reduce LOS levels to within the City's standards. However, the restriction may have other network and circuitry effects that should be analyzed separately before such a change is recommended. No modifications are recommended at this intersection.

- #6: Mission Boulevard & Harder Road:** This intersection continues to operate below the LOS standard, with an LOS F and more than 5 seconds of additional average control delay with the addition of project trips in the weekday AM peak hour. Therefore, intersection improvements should be identified.

The following intersection adjustments would reduce intersection delay to lower than Cumulative No Project levels:

- Run eastbound right Harder Road right-turn movements in an overlap phase with the corresponding protected left-turn and northbound through phases on Mission Boulevard. These changes would reduce overall average intersection delay to 151.3 seconds in the weekday AM peak hour (compared to Cumulative No Project average delay of 160.8 seconds). However, this adjustment would require prohibition of northbound and southbound U-turn movements which provides a network benefit that the City may prefer to retain.
- Restripe the outer through lane on the eastbound approach to provide a shared through/right-turn lane. This change would reduce overall average intersection delay to 148.0 seconds in the weekday AM peak hour. However, double turn lanes degrade the quality of

⁶ The full LOS worksheets and reports are provided in Appendix 4. The static outputs show an increase in AM peak hour delay with the addition of project trips. Due to the level of intersection oversaturation, the results do not show an increase with the addition of project trips in the PM peak hour. The volume input parameters appear to be outside the bounds of Synchro's implementation of Highway Capacity Manual methodologies. However, because additional delay in relation to traffic volumes is exponential in nature, it was judged that the addition of project trips would likely add more than five seconds of additional delay to the worst movement at the project intersection.

service and safety of pedestrians and bicyclists and may be undesirable to implement. Additionally, the existing Class II bicycle lane on Harder Road would need to be redesigned at the intersection approach to accommodate this change.

No intersection modifications are recommended at this location. The conditions described with this operational effect would not be realized until at least 2035 and can be reevaluated at that time based on actual counts rather than projected volumes.

- **#7 Harder Road & Dollar Street:** This intersection continues to operate below the LOS standard, with an LOS F and more than 5 seconds of additional average control delay with the addition of project trips in the weekday AM and PM peak hours. The intersection meets the peak hour signal warrant under Cumulative and Cumulative Plus Project conditions (see Table 21, Appendix 5, and Appendix 6). Therefore, intersection improvements should be identified.

It is recommended that a traffic signal be installed at this location. With signalization, the intersection would operate within the standard. Modeled with a traffic signal and a protected/permissive northbound left-turn phase, the intersection has an LOS B and is within City LOS standards in the weekday AM and PM peak hours. Since this operational deficiency and necessary improvement are also present under the Existing Plus Project scenario and this intersection serves as a primary access driveway for the Project, the project's fair share contribution to improvements is 100%.

Two other options were preliminarily considered at this location. One was a roundabout, which was considered infeasible as explained in Section 4.1. In addition, the Cumulative Plus Project intersection volumes would likely require a multilane roundabout, for which right-of-way needs would be more significant.

- **#11 Mission Boulevard & South Driveway:** Outbound drivers leaving the project driveway (i.e., eastbound right-turning drivers) experience an average of greater than 50 seconds of delay in the AM peak hour. However, outbound vehicles would queue onto the project site rather than into the public right-of-way. Queueing analysis indicates that the 95th percentile queue for the eastbound movement at this site is less than one car length (approximately 3 feet).

Source: Kittelson & Associates, 2021.

As shown in Table 22, the addition of project trips is not expected to contribute more than two car lengths to existing queues at study intersections, with the exception of the northbound approach at Harder Road & Dollar Street, the southbound approach to Harder Road & Dollar Street (3 car length addition), and the northbound and eastbound left turns at Mission Boulevard & Harder Road (2 car length addition). Because that intersection serves as a primary access driveway for the project site, northbound intersection approach queues would be accommodated on the project site rather than in the public right-of-way.

6 PUBLIC TRANSIT, PEDESTRIAN, AND BICYCLE ASSESSMENT

This section discusses potential effects on public transit, pedestrians, and bicyclists. To supplement this analysis, the Alameda County Transportation Commission (ACTC) Development Review Complete Streets Checklist was completed and is included as Appendix 7.

6.1 TRANSIT ASSESSMENT

Section 4 presented Existing Plus Project conditions and identified Harder Road & Dollar Street to operate below the LOS standard and meets the peak hour signal warrant in Existing Plus Project conditions. This intersection does not serve any AC Transit lines. No other intersections require improvement in the Existing Plus Project scenario.

Section 5 presented the Cumulative Plus Project conditions. That section also identified and identified Harder Road & Dollar Street to operate below the LOS standard and to meet the peak hour signal warrant. The analysis identified one location serving AC Transit lines along Mission Boulevard that does require improvement: Mission Boulevard & Harder Road (#6). Recommended improvements have been provided for both locations but are not feasible.

The project is not expected to degrade local access to bus stops along Mission Boulevard, which can be accessed via the local sidewalk network and existing facilities such as ADA curb ramps and continental crosswalks along Mission Boulevard. Therefore, implementation of the project would not conflict with plans, programs, and policies regarding transit facilities or decrease the performance and safety of such facilities.

6.2 PEDESTRIAN ASSESSMENT

As noted in Section 1.2.3, the study area features sidewalks, crosswalks, and curb ramps that are in good condition. Marked crosswalks (including continental crosswalks) and curb ramps with tactile warning devices are generally provided at arterial intersections. Residential street intersections tend to have unmarked crossings with ADA ramps.

As the project site plan shows (see Figure 8 on page 34), the project provides sidewalks and crossings for interior pedestrian access to the larger building or two the two smaller buildings from either access point. Pedestrians in the study area may also be affected due to an increase in vehicular trips to and from the site. Pedestrians traveling along Harder Road or Mission Boulevard may experience increased conflicts with vehicles entering or exiting the project site. Pedestrians will access the project site via either Harder Road access or the northern access driveway along Mission Boulevard.

Potential treatments at the project driveways can reduce the presence of these conflicts or reduce should be considered to increase pedestrian safety, as part of design review and conditions of approval. Treatments could include:

- Provide clear sight triangles at project driveways (i.e., free of landscaping and signage) and continue to disallow parking on the south side of Harder Road and the west side of Mission Street.
- Provide high-visibility (continental) striped crosswalks along the project driveways.
- Coordinate with the City of Hayward to install warning signage at the project driveways.

As described in Section 4.1, a traffic signal is recommended at the Harder/Dollar intersection (also the northern project driveway). Appendix D of the 2020 BPMP provides design guidelines for promoting pedestrian safety and access at traffic signals. The project should coordinate with the City to incorporate relevant design recommendations into the signal design, which includes:

- Include at least a four-second leading pedestrian interval (LPI) in the signal timing for all four pedestrian phases, which would give pedestrians a head start crossing the intersection and improve their visibility to right-turning motorists.
- Install high-visibility continental or ladder-style crosswalks and provide pedestrian signal phases across the three newly-marked crosswalks (across the east, west, and south legs). The signal should include pushbutton actuation for pedestrians and an accessible pedestrian signal (APS).

As noted in Section 1.2.3, the 2020 BPMP identified the full extent of Harder Road as a prioritized improvement corridor. The improvements above would address the project's frontage along the corridor.

The project would also add vehicle trips at Harder Road & Jane Road (#8), which is along the BPMP prioritized improvement corridor. The project should coordinate with the City to restripe existing crosswalks at this intersection as high-visibility (continental) crosswalks, consistent with recommended strategies identified in the BPMP.

6.3 BICYCLE ASSESSMENT

The project site plan (Figure 8 on page 34) includes an enclosure for dedicated bicycle parking. California Green Building Code (CALGreen) requirements for developers recommend providing bicycle parking for 5% of the vehicular parking spaces added on a site. The project site plan (Figure 8) proposes to provide 467 vehicle parking stalls, so 5% of vehicular parking would be a minimum of 24 bike parking stalls.

People accessing the site by bicycle would be able to access the site via Class II bicycle lanes on Harder Road. To enter the site along Harder Road traveling westbound, people biking would need to

merge across two through vehicle lanes into a left-turn pocket. As described in Section 4.1, a traffic signal is recommended at the Harder/Dollar intersection (also the northern project driveway). The eventual design of the traffic signal (see Sections 4.1 and 5.2) should include provision for left-turning bicyclists, which are described Appendix D of the 2020 BPMP and below.

There are no existing bicycle facilities along Mission Boulevard. The site design does not degrade bicycle accessibility, but the Harder Road & Dollar Street access is more amenable to people biking than the Mission Boulevard driveways given the bicycle facilities.

As discussed in Section 1.2.4, the City's BPMP includes recommendations for the following bicycle facilities, both of which front the project site:

- Class IV separated bike lanes on Mission Boulevard throughout the study area
- Class IV separated bike lanes on Harder Road throughout the study area

The project should coordinate with the City to provide funding for future Class IV separated bike lanes along Harder Road and Mission Boulevard along the project frontages or in-lieu funding for similar bicycle improvements in the project vicinity. The project should coordinate with the City to identify opportunities for interim bicycle facility striping along Harder Road between Jane Avenue and Dollar Street (the project site).

Additionally, recommended traffic signal should include the following design elements to promote bicycle access, comfort, and safety:

- Install KEEP CLEAR pavement markings in the Harder/Dollar intersection.
- Stripe two-stage turn queue boxes for both eastbound and westbound left turns for people biking. Pages 25-26 of Appendix D of the Hayward Bicycle and Pedestrian Master Plan (BPMP) include details and guidance for designing and installing the treatment.
- Install an advanced stop bar (“bike box”) on the eastbound approach to Harder/Dollar for people biking to position themselves in front of drivers turning right at Dollar Street or at Mission Boulevard. Details and design guidance are provided on pages 23-24 of Appendix D to the BPMP.
- Provide green “crossbike” markings to continue the bicycle lane and clearly delineate space for people biking through the intersection along Harder Road eastbound and westbound. Pages 27-28 of Appendix D to the BPMP include details and design guidance.

These recommendations are discussed in more detail in the memorandum attached in Appendix 8 which analyzes signal feasibility. Recommendations at this location include:

7 PARKING ANALYSIS

This section compares project parking provision to City requirements and provides a qualitative analysis of street parking in the study area. The project is subject to the parking requirements within the S-T4 and S-T5 zones within the South Hayward BART Form-Based Code (FBC). The FBC does not have a minimum or maximum parking standards for non-residential uses; thus the proposed project complies with the City's off-street parking standards for parcels within the Code area.

The project site plan includes 467 parking stalls.

The project is immediately surrounded by Mission Boulevard and Harder Road, both of which are arterial roadways that prohibit on-street parking in the immediate project vicinity. Free street parking is available on the west side of Dollar Street north of Harder Road and on the residential streets west of Whitman Street over 1,000 feet from the project site (including Jane Avenue and Eastman Street). On these streets, street parking is typically highly utilized by residents.

8 CIRCULATION AND ACCESS

This section provides an overview of site access and on-site circulation.

8.1 TRUCK AND DELIVERY VAN ACCESS

An analysis of the project driveways and internal site was conducted using AutoCAD AutoTurn to assess circulation and site access for delivery vehicles, emergency vehicles, and garbage trucks. Specifically, AutoTurn templates were prepared for a WB-67 truck. The routes to, through, and from the project site are displayed in Figure 14. Movements that the WB-67 can navigate into and out of the site, and along the site's primary drive aisles and to loading bays behind the retail buildings. The turning analysis also displays the trash collection vehicle path through the site.

The analysis indicates that the WB-67 trucks would over-track into the incoming lane in order to make right-turn movements into and out of the site as shown. Given that all of the driveways are well utilized and serve a relatively high volume of traffic in the AM and PM peak hours, it is recommended that project tenants prioritize WB-67 trucks to schedule making deliveries to the site outside the peak hours (7:00-9:00 AM and 4:00-6:00 PM) when possible. The potential conflict the larger delivery trucks would present during the peak hours would have adverse effects related to site access and circulation into, out of, and within the site.

As demonstrated in Figure 14 and discussed above, trucks and delivery vehicles are able to navigate the site internally (drive aisles and loading docks) as necessary. Since the analysis demonstrates that larger delivery trucks are able to navigate the driveways and drive aisles, it is expected that the smaller garbage trucks and emergency vehicles (standard fire truck) would also be accommodated by the project site.

8.2 PASSENGER VEHICLES

Turn template analysis was not prepared for passenger vehicles, since the delivery truck templates represent the largest vehicles expected to enter and exit the site. Given the results of the truck turning templates, it is expected that the driveway and drive aisles are sufficient to accommodate passenger vehicles.

The drive-through restaurants at Pad A and Pad B provide storage space for 25 and 22 passenger car vehicles, respectively. The drive-through sites are oriented so that queued and inbound traffic would queue onsite and, if they spill back, would spill into the parking lot and drive aisles rather than blocking access to/from Harder Road or Mission Boulevard.

If, upon building occupancy, reoccurring queueing occurs and spills back to obstruct access to and from Harder Road or Mission Boulevard, the City may request the project owner to employ queue management and abatement methods. Suggested methods include:

- A lot attendant or other active management of queueing vehicles during peak periods, or
- Redesign of queue storage to improve vehicle circulation and/or queue capacity.

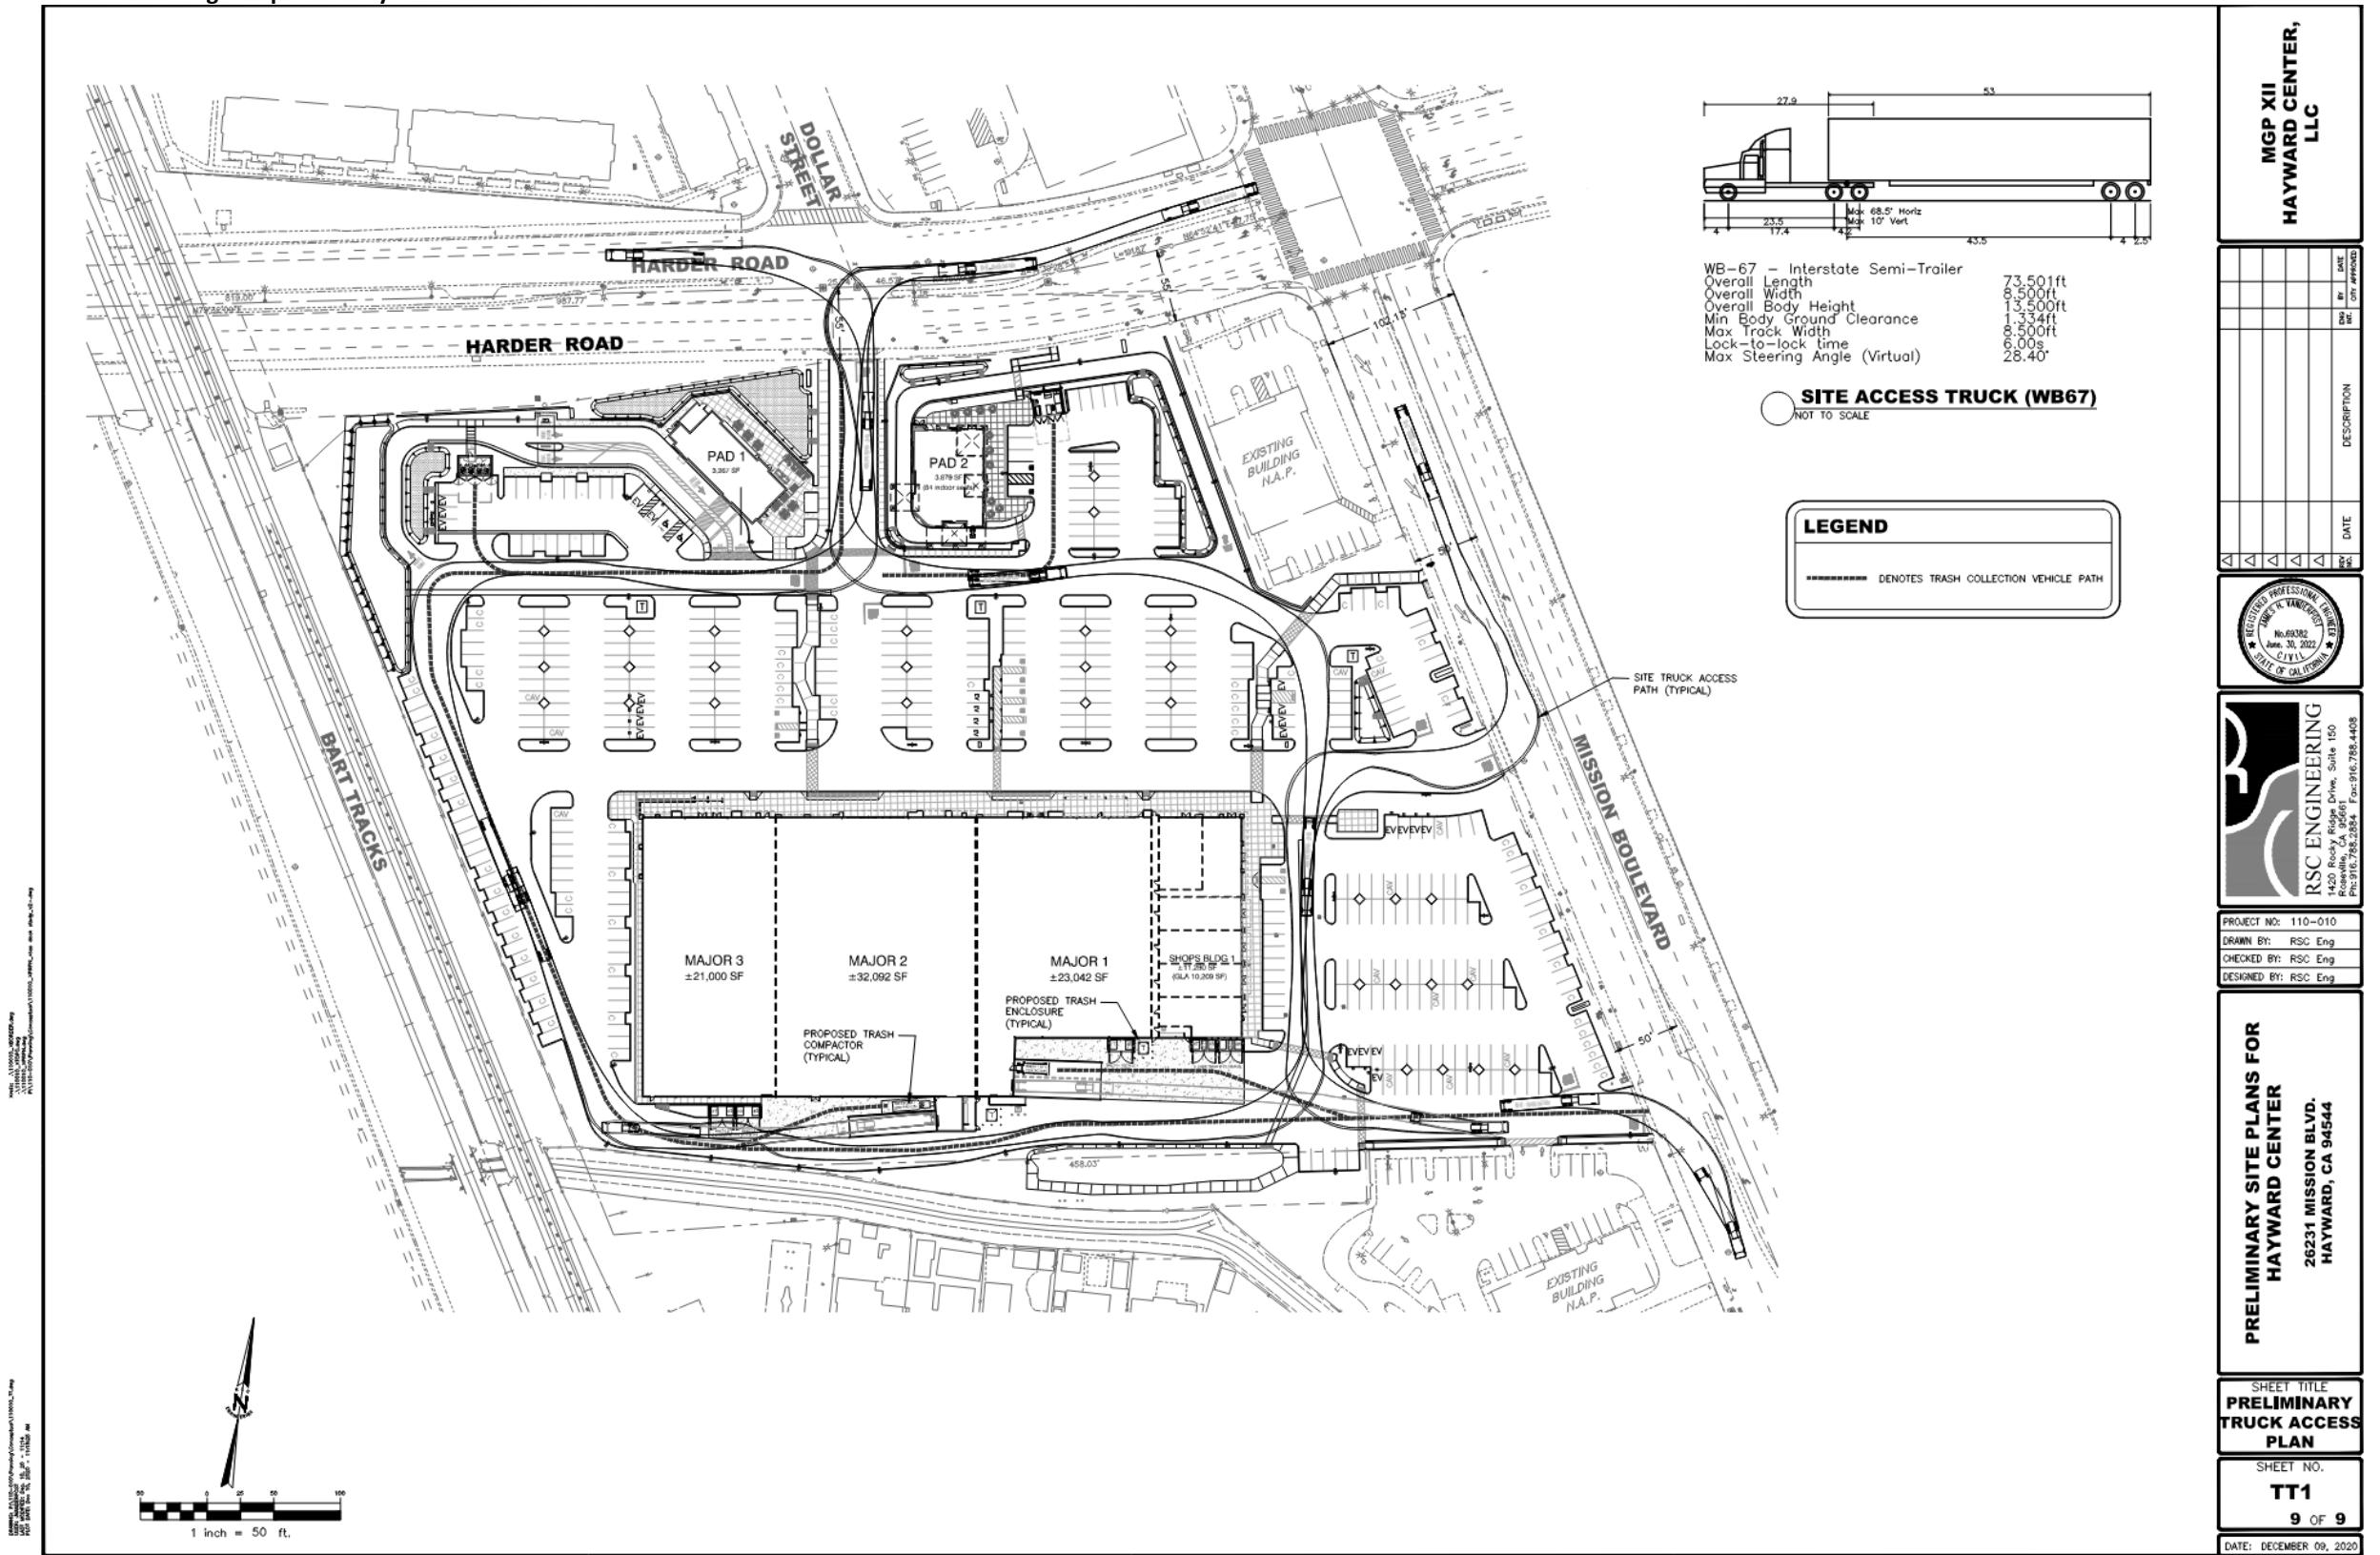

As stated in Section 4, the analysis is intended to represent typical conditions, which can be expected to differ from initial opening conditions. Within the first weeks or months of project occupancy, project-related travel may either be lower than conditions described in this analysis (if the site is only partially occupied initially) or higher (if there is a “breaking in” period associated with newly available retail opportunities). Either circumstance would be expected to converge to a typical operation condition, as described in this section.

8.3 PEDESTRIANS AND BICYCLISTS

Pedestrian and bicyclist access to and from the site was discussed in Sections 6.2 and 6.3, respectively. The project site plan provides sidewalks on the Harder Road access, on the south side of the Mission Boulevard northern driveway access, and on the south side of the Mission Boulevard southern driveway access. The site plan also provides interior circulation via sidewalks, curb ramps, and marked/stripped paths within the site. Bicyclists would share the travel paths with people driving once on site. The project site plan includes an enclosure for dedicated bicycle parking on site.

Recommended pedestrian- and bicyclist-oriented improvements for the project driveways and project site are provided in Sections 6.2 and 6.3.

Figure 14: Truck Turning Template Analysis

9 SUMMARY OF FINDINGS

The *CEQA Transportation Analysis Report* determined that the project would not be expected to contribute additional VMT and would result in a **less-than-significant** transportation impact under CEQA. No mitigation measures were identified in that report.

The following non-CEQA recommendations have been made in this local transportation assessment, to be incorporated as part of this project:

- Install a traffic signal at Harder Road & Dollar Street. With signalization, the intersection would operate within City level-of-service (LOS) standards. A signal was modeled with a protected/permissive northbound left-turn phase. In Existing Plus Project and Cumulative Plus Project conditions, the signal operates at LOS B and within City standards during the weekday AM and PM peak hour. Since the project results in operational deficiencies under the Existing Plus Project scenario and the intersection serves as a primary access driveway for the project, the project's fair share contribution to improvements is 100%.

Signalization of this intersection would provide an additional controlled pedestrian crossing of Harder Road and would improve pedestrian access to and from the project site. Separate simulation analysis, documented in the memorandum included in Appendix 8, demonstrated that the signal is feasible from an operations standpoint. That memorandum included the following recommendations for the traffic signal:

- Provide a dedicated left-turn lane and a shared right/through lane on the northbound approach at Harder/Dollar. The project proposed site plan can accommodate a 11-foot-wide left-turn lane, an 11-foot-wide through/right turn lane, and a 13-foot, 9-inch-wide southbound receiving lane.
- Connect the Harder/Dollar signal controller to the existing SCATS coordinated system at Mission/Harder. Per City staff advisement, coordination would also require connecting the controller at Harder Road & Jane Avenue to the system. This connection along Harder Road from Mission Boulevard to Jane Avenue would create a larger coordinated system that would adjust signal cycles dynamically to maintain smooth traffic flow through the new traffic signal at Harder Road/Dollar Street while allowing phasing to be responsive to future traffic demands.
- Install KEEP CLEAR pavement markings in the Harder/Dollar intersection.
- Install high-visibility continental or ladder-style crosswalks and provide pedestrian phases across all four legs of the Harder/Dollar intersection. Dollar Street currently has a marked east-west crosswalk on the north leg. The signal should include pushbutton actuation for pedestrians and APS.
- Include at least a four-second LPI in the signal timing for all four pedestrian phases, which would give pedestrians a head start crossing the intersection.
- Stripe two-stage turn queue boxes for both eastbound and westbound left turns for people biking. Pages 25-26 of Appendix D of the Hayward Bicycle and Pedestrian Master Plan (BPMP) include details and guidance for designing and installing the treatment.

- Install an advanced stop bar (“bike box”) on the eastbound approach to Harder/Dollar for people biking to position themselves in front of drivers turning right at Dollar Street or at Mission Boulevard. Details and design guidance are provided on pages 23-24 of Appendix D to the BPMP.
- Provide green “crossbike” markings to continue the bicycle lane and clearly delineate space for people biking through the intersection along Harder Road eastbound and westbound. Pages 27-28 of Appendix D to the BPMP include details and design guidance.
- When designing the horizontal geometry for the intersection, consider pulling back the left-turn stop bar to allow for truck over tracking.

Additional recommendations related to site access include:

- Coordinate with the City to provide treatments at the project driveways to reduce the presence of vehicle-pedestrian conflicts and to increase pedestrian and bicycle safety, as part of design review and conditions of approval. Treatments could include:
 - Providing clear sight triangles at project driveways (i.e., free of landscaping and signage) and continuing to disallow parking on the south side of Harder Road and the west side of Mission Street.
 - Installing green paint to indicate conflict areas at the project driveway and on intersection approaches along Harder Road in the study area.
- The project should coordinate with the City to provide funding for future Class IV separated bike lanes along Harder Road and Mission Boulevard along the project frontages or in-lieu funding for similar bicycle improvements in the project vicinity. As an interim treatment, the project should coordinate with the City to provide a striped bicycle facility along Harder Road between Jane Avenue and Dollar Street.
- The project should coordinate with the City of Hayward to determine the number and location of short-term and long-term bicycle parking spaces to be provided.
- The project sponsor should coordinate with the City to restripe existing marked crosswalks at Harder Road & Jane Road (#8) as high-visibility (continental) crosswalks, given that Harder Road is a prioritized improvement corridor as identified in the BPMP.
- It is recommended that project tenants prioritize larger trucks (i.e., larger than a 30- or 40-foot long single unit truck) make deliveries to the site outside the peak hours (7:00-9:00 AM and 4:00-6:00 PM) when possible to avoid potential conflicts associated with turning movements at project driveways.

Turning Movement Report

Prepared For:

Kittelson & Associates, Inc.
155 Grand Avenue, Suite 900
Oakland, CA 94612

LOCATION Harder Road @ Soto Road
COUNTY Alameda
COLLECTION DATE Thursday, June 02, 2016
CYCLE TIME 108 Seconds

N/S STREET Soto Road
E/W STREET Harder Road
WEATHER Sunny and Clear
CONTROL TYPE Signal

COMMENTS Eastbound and westbound left turns are protected. Northbound and southbound left turns are permitted.

Appendix 2 Existing Level of Service,
Queue, and Peak Hour Traffic

Warrant Summary

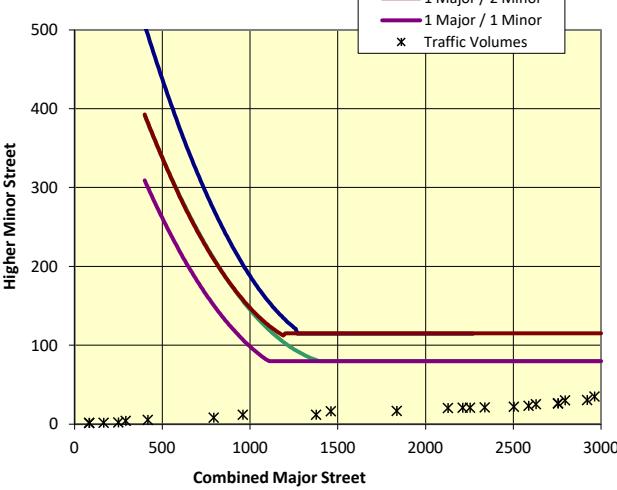

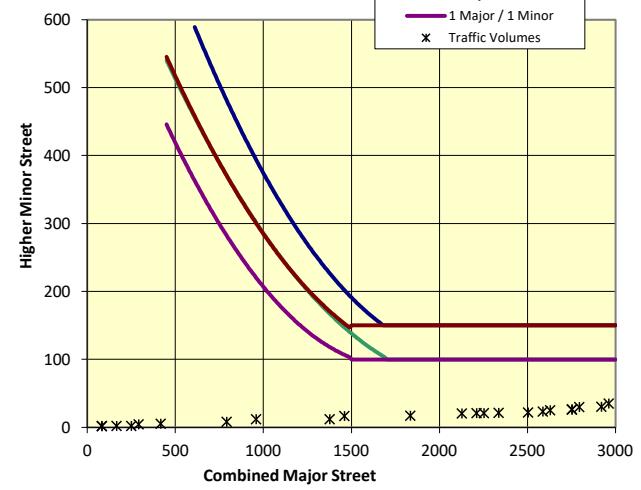

Warrant	Name	Analyzed?	Met?
#1	Eight-Hour Vehicular Volume	Yes	Yes
#2	Four-Hour Vehicular volume	Yes	Yes
#3	Peak Hour	Yes	Yes
#4	Pedestrian Volume	No	-
#5	School Crossing	No	-
#6	Coordinated Signal System	No	-
#7	Crash Experience	No	-
#8	Roadway Network	No	-
#9	Intersection Near a Grade Crossing	No	-

Input Parameters

Volume Adjustment Factor =	1.0
North-South Approach =	Minor
East-West Approach =	Major
Major Street Thru Lanes =	2
Minor Street Thru Lanes =	1
Speed > 40 mph?	No
Population < 10,000?	No
Warrant Factor	100%
Peak Hour or Daily Count?	Peak Hour
Major Street: 4th-Highest Hour / Peak Hour	89%
Major Street: 8th-Highest Hour / Peak Hour	83%
Minor Street: 4th-Highest Hour / Peak Hour	76%
Minor Street: 8th-Highest Hour / Peak Hour	59%

Warrant #1 - Eight Hour

Warrant Factor	Condition	Major Street Requirement	Minor Street Requirement	Hours That Condition Is Met	Condition for Warrant Factor Met?	Signal Warrant Met?
100%	A	600	150	2	No	
	B	900	75	13	Yes	
80%	A	480	120	4	No	
	B	720	60	15	Yes	
70%	A	420	105	7	No	
	B	630	53	15	Yes	
56%	A	336	84	13	Yes	
	B	504	42	17	Yes	

Warrant #2 - Four-Hour 100% Warrant Factor

Warrant #3 - Peak Hour 100% Warrant Factor

Checklist

Development Review Complete Streets Checklist

This checklist is designed to assist the applicant and jurisdiction staff identify and assess a range of Complete Streets-related needs in the vicinity of each development. These needs, if addressed, would better serve the multimodal transportation needs of those coming and going from the site and the surrounding area. The checklist is to be completed during the pre-application phase, but can be used as a reference throughout the development and design of the project. Following completion of the checklist, staff will identify and document project modifications for further evaluation and discussion.

Project Name: Hayward Retail Center

Project Description / Project Type: Retail

Project Location :26231 Mission Boulevard, Hayward, California

Project Manager: Mike Alston, Kittelson & Associates, Inc.

Anticipated construction date: 2022

Pre-Application Phase

Project Description

1. What are the proposed land uses (check all that apply)?

- residential commercial /mixed use industrial
 civic/institutional other: Click or tap here to enter text.

2. What are the major trip generators near the project site, if any?

(existing and future)

- | | |
|--|---|
| a) Schools | <input checked="" type="checkbox"/> yes <input type="checkbox"/> no |
| b) Major employers | <input checked="" type="checkbox"/> yes <input type="checkbox"/> no |
| c) Civic/community destinations | <input checked="" type="checkbox"/> yes <input type="checkbox"/> no |
| d) Medium to high-density residential | <input checked="" type="checkbox"/> yes <input type="checkbox"/> no |
| e) Senior centers/healthcare facilities | <input type="checkbox"/> yes <input checked="" type="checkbox"/> no |
| f) Daily needs (grocery, retail, etc.) | <input checked="" type="checkbox"/> yes <input type="checkbox"/> no |
| g) Other: Click or tap here to enter text. | |

3. Is the project site located on the path to/from nearby trip generators?

- yes no

Explain: Mission Blvd. is a state route east of the project site.

4. Based on the modal priority maps (available at <https://alameda-ctc.maps.arcgis.com/apps/View/index.html?appid=2040175145de4305a5f59c6e82ca16c7>), list the modal priorities on adjacent streets (check all that apply):

Adjacent Street 1 Name: Mission Boulevard

Auto	<input checked="" type="checkbox"/> First	<input type="checkbox"/> Second	<input type="checkbox"/> Other
Bicycle	<input type="checkbox"/> First	<input checked="" type="checkbox"/> Second	<input type="checkbox"/> Other
Pedestrian	<input type="checkbox"/> First	<input type="checkbox"/> Second	<input type="checkbox"/> Other
Transit	<input type="checkbox"/> First	<input type="checkbox"/> Second	<input type="checkbox"/> Other
Trucks	<input type="checkbox"/> First	<input type="checkbox"/> Second	<input type="checkbox"/> Other

Adjacent Street 2 Name: Harder Road

Auto	<input type="checkbox"/> First	<input type="checkbox"/> Second	<input type="checkbox"/> Other
Bicycle	<input checked="" type="checkbox"/> First	<input type="checkbox"/> Second	<input type="checkbox"/> Other
Pedestrian	<input type="checkbox"/> First	<input checked="" type="checkbox"/> Second	<input type="checkbox"/> Other
Transit	<input type="checkbox"/> First	<input type="checkbox"/> Second	<input type="checkbox"/> Other
Trucks	<input type="checkbox"/> First	<input type="checkbox"/> Second	<input type="checkbox"/> Other

Adjacent Street 3 Name: Click or tap here to enter text.

Auto	<input type="checkbox"/> First	<input type="checkbox"/> Second	<input type="checkbox"/> Other
Bicycle	<input type="checkbox"/> First	<input type="checkbox"/> Second	<input type="checkbox"/> Other
Pedestrian	<input type="checkbox"/> First	<input type="checkbox"/> Second	<input type="checkbox"/> Other
Transit	<input type="checkbox"/> First	<input type="checkbox"/> Second	<input type="checkbox"/> Other
Trucks	<input type="checkbox"/> First	<input type="checkbox"/> Second	<input type="checkbox"/> Other

Work with Transportation and Engineering Staff to fill out questions 5-8.

5. Within the past five years, have there been any fatal or severe injury collisions within $\frac{1}{4}$ mile of the site? yes no

If yes, explain: *Broadside fatal crash occurred on roadway 1,075 feet south of Mission Boulevard and Harder Road. Fatal crash occurred south of the project site.*

6. Within the past five years, have there been any collisions within $\frac{1}{4}$ mile of the site involving pedestrians or bicyclists? yes no

If yes, explain: *Eight crashes involved pedestrians and one crash involved a bicyclist. One pedestrian related crash was a fatal crash.*

7. Have you observed other opportunities to improve safety performance? (based on field observation) yes no

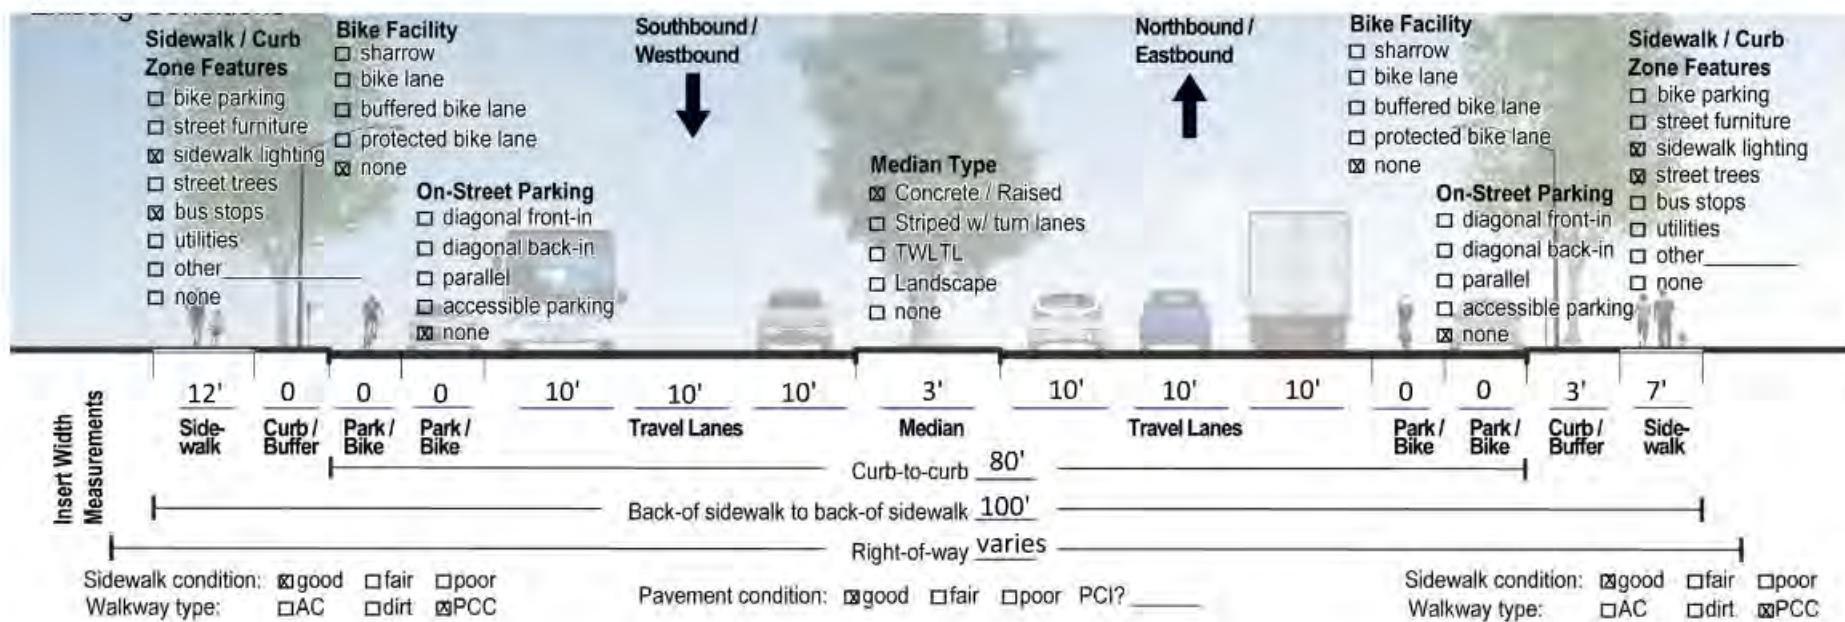

If yes, note: Pedestrian crossings on Harder Road in the project vicinity are limited to signalized intersections and one improved crossing at Franklin Avenue--four crossing locations in about 3,000 feet (one every 750 feet). The crossings at Franklin Avenue and Mission Boulevard are high-visibility continental crossings; the crossings at Soto Road and Jane Avenue are basic transverse crossings striped yellow for school proximity. More frequent crossing opportunities would improve pedestrian accessibility and safety.

Harder Road includes on-street Class II bicycle lanes but the 2020 Hayward Bicycle and Pedestrian Master Plan recommends separated Class IV bicycle lanes which would improve comfort and safety. The Plan also recommends Class IV bicycle lanes on Mission Boulevard, which does not include any bicycle facilities in the study area.

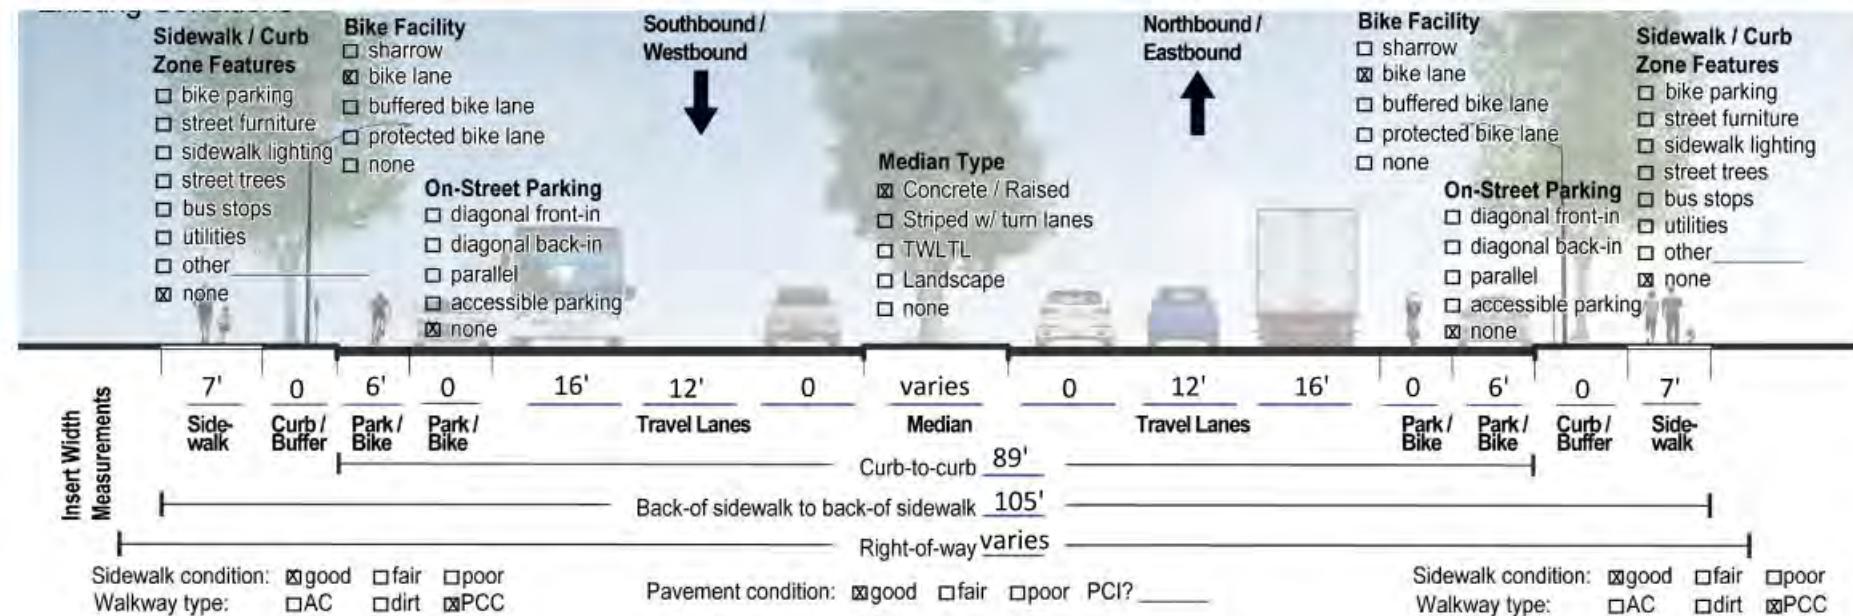

Existing Physical Conditions

8. What are the existing right-of-way elements adjacent to the project site? Use cross section graphic for each street adjacent to the site.

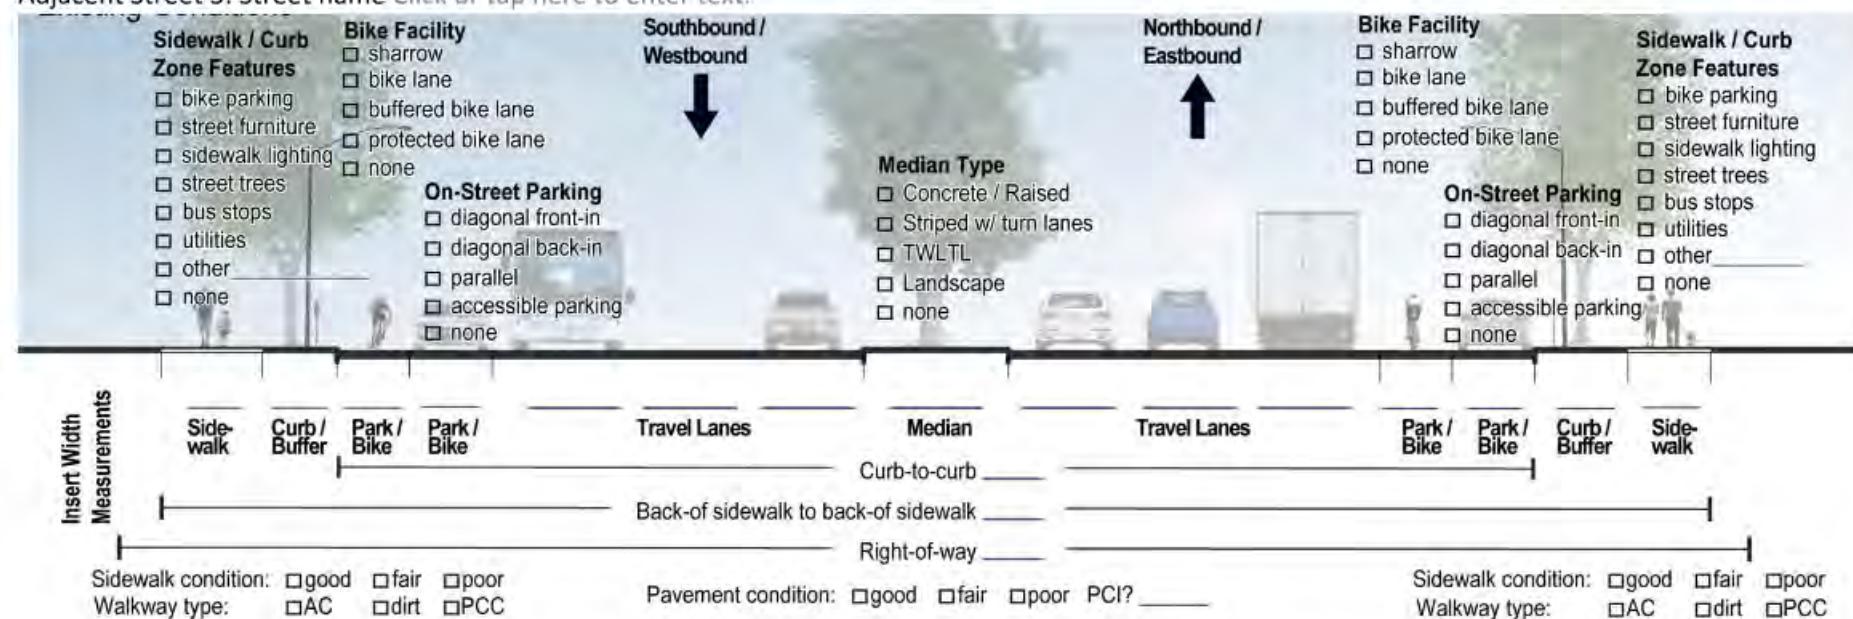

Adjacent Street 1 name: Mission Boulevard

Adjacent Street 2 name: Harder Road

Adjacent Street 3: Street name Click or tap here to enter text.

Plans, Policies, Guidelines, and Standards

9. What are relevant ongoing or existing plans?

Plan	Identified Needs (yes or no)				
	Ped	Bike	Transit	Vehicular	Other
Bicycle and Pedestrian Master Plan	<input checked="" type="checkbox"/> yes <input type="checkbox"/> no	<input checked="" type="checkbox"/> yes <input type="checkbox"/> no	<input checked="" type="checkbox"/> yes <input type="checkbox"/> no	<input type="checkbox"/> yes <input type="checkbox"/> no	<input type="checkbox"/> yes <input type="checkbox"/> no

List any transportation improvement needs identified in the plan documents listed above:

Bicycle and Pedestrian Master Plan was completed in 2020.

The Plan designates the following roadways as Pedestrian High Injury Corridors:

- Harder Road between Soto Road and Jane Avenue
- Mission Boulevard between Webster Street and Tennyson Road

Class IV bicycle facilities are recommended along Mission Boulevard and Harder Road.

Transportation Evaluation

10. Indicate whether the following elements have been evaluated for existing conditions at the site and surrounding area and list the result for each mode:

Pedestrian

Internal site circulation and pedestrian routes	<input checked="" type="checkbox"/> yes <input type="checkbox"/> no
Site access and street frontage	<input checked="" type="checkbox"/> yes <input type="checkbox"/> no
Signage and wayfinding	<input type="checkbox"/> yes <input checked="" type="checkbox"/> no
Intersections and street crossings	<input checked="" type="checkbox"/> yes <input type="checkbox"/> no
Access to/from surrounding area	<input checked="" type="checkbox"/> yes <input type="checkbox"/> no
Lighting	<input type="checkbox"/> yes <input checked="" type="checkbox"/> no
ADA facilities	<input checked="" type="checkbox"/> yes <input type="checkbox"/> no
Other: Click or tap here to enter text.	<input type="checkbox"/> yes <input type="checkbox"/> no

List any pedestrian deficiencies identified:

No marked pedestrian crossing across Harder Road to project site.

Bicycle

Parking supply and ease of use	<input type="checkbox"/> yes <input checked="" type="checkbox"/> no
Site access	<input checked="" type="checkbox"/> yes <input type="checkbox"/> no
Signage and wayfinding	<input type="checkbox"/> yes <input checked="" type="checkbox"/> no
Intersections	<input checked="" type="checkbox"/> yes <input type="checkbox"/> no
Access to/from surrounding area	<input checked="" type="checkbox"/> yes <input type="checkbox"/> no
Other: Click or tap here to enter text.	<input type="checkbox"/> yes <input type="checkbox"/> no

List any bicycle deficiencies identified:

No bicycle facilities along Mission Boulevard.

No bicycle intersection treatments at Harder Road & Dollar Street (project entrance).

Auto

On-street parking

 yes no

Off-street parking

 yes no

Disabled parking

 yes no

Green infrastructure

 yes no

Driveway placement and ped/bike conflict points

Turning radii

 yes no

Emergency vehicle access

 yes no

Other: Click or tap here to enter text.

 yes no*List any truck/heavy vehicle deficiencies identified:*

Click or tap here to enter text.

11. How does the proposed site design impact conditions for each mode? If negative or positive, note the impact. (Note: both negative and positive impacts could be found for one mode.)

Mode	Impacts		
Auto	<input type="checkbox"/> positive <input type="checkbox"/> neutral <input checked="" type="checkbox"/> negative	Increased delay at Harder Road & Dollar Street plus peak hour signal warrant met	
Bicycle	<input type="checkbox"/> positive <input type="checkbox"/> neutral <input checked="" type="checkbox"/> negative	<i>Without improvement at Harder Road & Dollar Street, increased conflicts at project driveway. With signalization improvement, neutral or positive.</i>	
Pedestrian	<input type="checkbox"/> positive <input checked="" type="checkbox"/> neutral <input type="checkbox"/> negative	<i>Without improvement at Harder Road & Dollar Street, increased conflicts at project driveway. With signalization improvement, neutral or positive.</i>	
Transit	<input type="checkbox"/> positive <input type="checkbox"/> neutral <input checked="" type="checkbox"/> negative	<i>Increased delay at Mission Boulevard & Harder Road (intersection serves AC Transit lines 99 and 801)</i>	
Trucks	<input type="checkbox"/> positive <input checked="" type="checkbox"/> neutral <input type="checkbox"/> negative	-	
Other mode?	<input type="checkbox"/> positive <input type="checkbox"/> neutral <input type="checkbox"/> negative		

Other mode?	<input type="checkbox"/> positive <input type="checkbox"/> neutral <input type="checkbox"/> negative	Click or tap here to enter text.
-------------	--	----------------------------------

External Agency/Stakeholder Coordination

12. List agencies requiring coordination:

Agency	Has coordination occurred? Note any issues that are outstanding.
AC Transit	<input type="checkbox"/> yes <input checked="" type="checkbox"/> no
Click or tap here to enter text.	<input type="checkbox"/> yes <input type="checkbox"/> no
Click or tap here to enter text.	<input type="checkbox"/> yes <input type="checkbox"/> no

This project is not expected to need stakeholder coordination.

Maintenance and Construction Phase Considerations

13. How will access for all modes be maintained during construction (check one box per mode)?

Agency	Auto	Bicycle	Pedestrian	Transit	Trucks
Detour for duration of project	<input type="checkbox"/>				
Time-of-day closures only (e.g. nighttime)	<input type="checkbox"/>				
Short-term closures (e.g. 24 hour) with detour route	<input type="checkbox"/>				
Access maintained with reduced facilities*	<input type="checkbox"/>				
Full access maintained (work does not impact mode)	<input checked="" type="checkbox"/>				
Other	<input type="checkbox"/>				

**"Access maintained with reduced facilities" could mean some travel lanes closed for vehicles; could mean bicycle lane is closed, with signage for bicycles to share travel lane; could mean that sidewalk is closed with pedestrian space provided on shoulder; could mean that some transit stops are closed; etc.)

14. Will any transportation facilities or street elements be privately maintained? yes no

If yes, explain: Click or tap here to enter text.

15. Will Complete Streets design be applied on privately maintained facilities? yes no

Appendix 8 Traffic Simulation Memorandum

Project# 25541

To: Steven Chang, Transportation Planner
City of Hayward
From: Mike Alston, RSP; Damian Stefanakis; Felipe Ladron de Guevara, PhD
RE: Hayward Retail Center Traffic Signal Simulations

INTRODUCTION AND KEY FINDINGS

A local transportation assessment (LTA) was conducted for the proposed Hayward Retail Center project (project) located in Hayward, California (City). The project is located at the former Kmart site at 26231 Mission Boulevard at the southwest corner of Mission Boulevard & Harder Road (assessor's parcel number 452-0020-009-01). The project would consist of:

- An approximately 3,267 square-foot drive-through restaurant
- An approximately 3,879 square-foot drive-through restaurant
- An approximately 88,000 square-foot commercial building, subdivided into nine tenants ranging from approximately 1,800 square feet to approximately 32,000 square feet

The LTA found the Harder Road & Dollar Street intersection to operate below the City's level-of-service standards (LOS E or better) and to meet peak hour signal warrants in all analysis scenarios. The LTA thus included a recommendation to install a traffic signal at the Harder Road/Dollar Street (Harder/Dollar) intersection. With signalization, the intersection was projected to operate within City LOS standards. Per discussions with City Engineering staff and based on the LTA findings, additional analysis was necessary to analyze the feasibility of adding the recommended traffic signal. This memorandum presents the feasibility analysis and recommendations for signal timing, coordination, and design.

This analysis described in this memorandum tested the operational effects of installing a traffic signal at Harder/Dollar as proposed in the project LTA based on the City's operations thresholds. Simulations of site access were limited to the Harder/Dollar access and did not include the driveways along Mission Boulevard. This memorandum concludes that from an operational standpoint, a traffic signal is feasible. The memorandum includes recommendations to minimize potential operational effects and improve conditions for all users at the site. Those recommendations are listed on page 16.

The memorandum is organized as follows:

- Background and Key Issues
- Analysis Methodology
- Feasibility Evaluation
- Recommendations

BACKGROUND AND KEY ISSUES

The LTA analyzed Harder/Dollar and the nearby Mission Boulevard & Harder Street (Mission/Harder) intersections in the following analysis scenarios (weekday AM and PM peak hours):

- Existing Conditions
- Existing Plus Project Conditions
- Cumulative Conditions
- Cumulative Plus Project Conditions

The Harder/Dollar intersection is a two-way stop control intersection with stop control on the north and south legs (Dollar Street and the project driveway, respectively). The intersection would be one of three access points to the project site. The intersection was found to operate below the City's LOS standards (with an LOS score of F) and was found to meet the peak hour signal warrant in all analysis scenarios.

The LTA included a recommendation to install a traffic signal at Harder Road & Dollar Street (see Figure 1). With signalization, the intersection is projected to operate within City level-of-service (LOS) standards. Signalization would also provide an opportunity for an additional controlled pedestrian crossing of Harder Road that would improve pedestrian access to and from the project site.

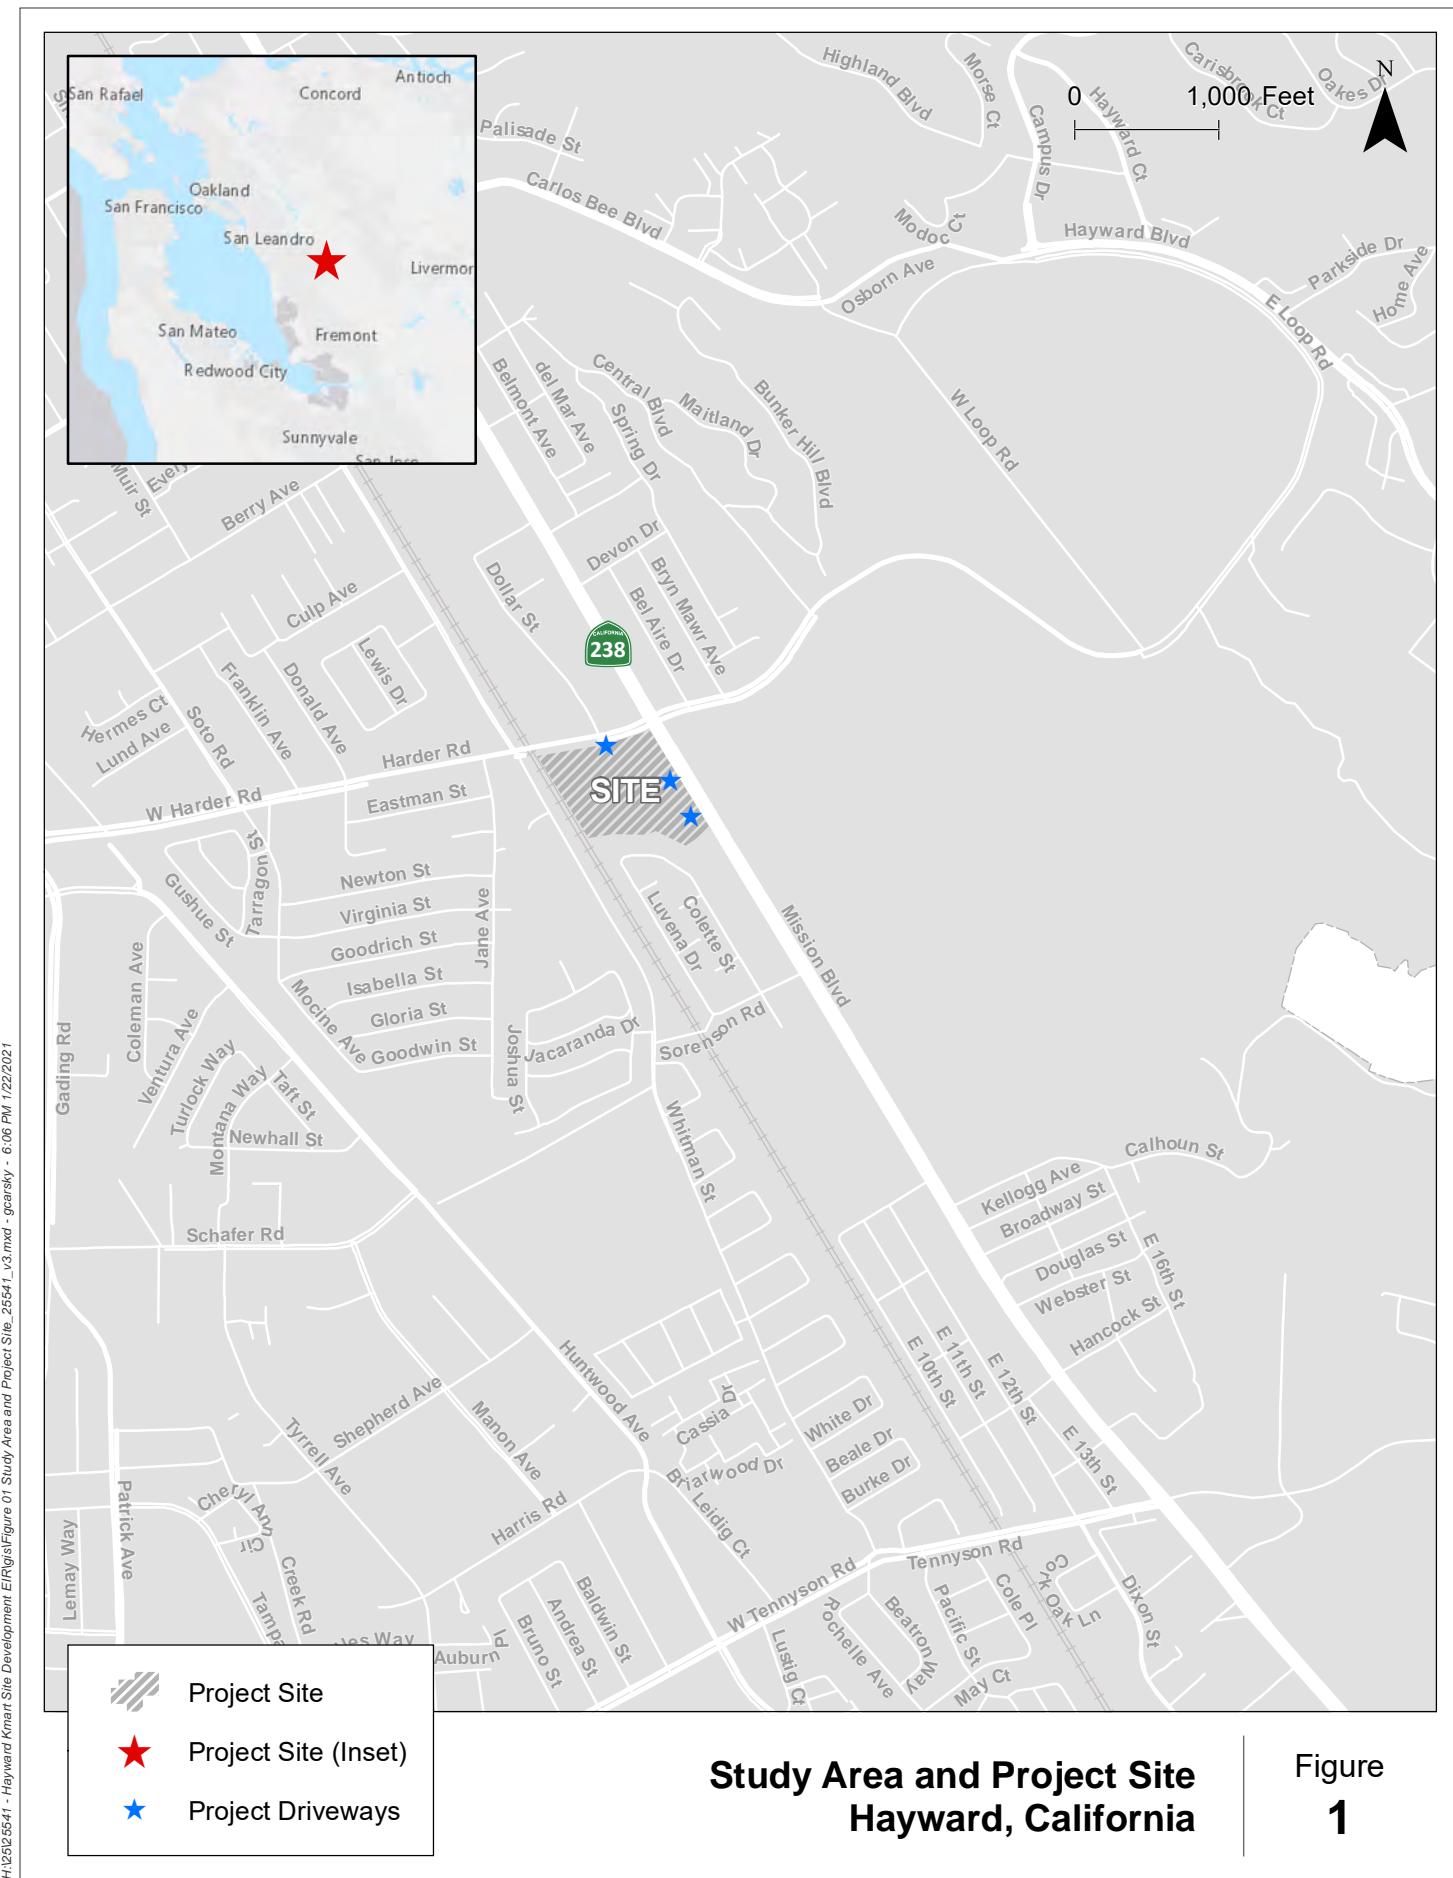

The Harder/Dollar intersection is about 375 feet west of a signalized intersection with Mission Boulevard and includes a westbound left-turn pocket just under 100 feet in length. Operations at the Harder/Dollar intersection could result in negative spillover effects at Mission/Harder (and vice versa). In particular, a traffic signal at Harder/Dollar (which would require drivers on Harder Street to stop during red signal phases) could introduce some of the effects described below.

- Westbound queuing at Harder/Dollar spilling back to the Mission/Harder intersection, blocking access for conflicting movements at the Mission/Harder intersection.
- Eastbound queuing at Mission/Harder spilling back into the Harder/Dollar intersection, blocking access for conflicting movements at the Harder/Dollar intersection. The potential for this conflict already exists without the traffic signal, but such queuing could conflict with dedicated green phases on Dollar Street intended to serve traffic northbound and southbound trips.
- Any of the potential queuing spillover could cause vehicles to block crosswalks and preclude pedestrian access.

Queuing on the northbound Dollar Street approaches is of less concern for the feasibility of a signal for three reasons. First, queues on either approach would not extend back to adjacent nearby intersections. Second, for the northbound approach, any queuing would be contained within the project site rather than on public right-of-way. Third, a signal would almost certainly improve queuing along Dollar Street compared to the existing stop control, especially during the peak hours analyzed.

The project site features retail, so site access for large trucks (i.e., AASHTO WB-67 or other trucks larger than a 30- or 40-foot long single unit truck) would be required. The ability for large trucks to access the site using Harder/Dollar is of interest, although alternate access would also be provided along Mission Boulevard.

Notwithstanding the potential effects listed above, a traffic signal would improve service for minor street movements by providing a dedicated signal phase. This would provide benefit to drivers accessing the project site or accessing the commercial properties and residential development along Dollar Street north of Harder Road (whose main access point is the Harder/Dollar intersection). A signal also brings potential benefits to pedestrians and people biking with respect to access, safety, and comfort as described in subsequent sections of this memorandum.

Figure
1

The analysis presented in subsequent sections of this memorandum uses traffic simulation and a number of performance measures to determine the feasibility of a traffic signal at Harder/Dollar, as well as any operational and safety effects.

ANALYSIS METHODOLOGY

For the LTA analysis, Kittelson conducted static traffic operations analysis using Synchro. For this more detailed feasibility analysis, Kittelson conducted traffic simulation using SimTraffic software. Simulation provides more robust results than a static analysis because it provides a more accurate representation of random fluctuation throughout the peak analysis period and the resulting queueing conditions that would occur, as well as the interrelationship between intersections related to signal timing between and among intersections.

The following scenarios were modeled with simulation:

- Existing Conditions weekday AM peak hour and weekday PM peak hour
- Existing Plus Project Conditions weekday AM peak hour and weekday PM peak hour

Simulation analysis models were developed for each scenario using the static analysis models from the LTA analysis as a basis. The Existing Conditions models match the existing lane configuration and geometry. Field visits were conducted in the AM and PM peak period on Thursday, February 25, 2021, to calibrate the simulation model to observed field conditions (e.g., lane utilizations, pedestrian activity, signal operations, driveway activity and queue lengths in the peak hours).¹ The Existing Conditions AM and PM peak hour simulation models were first run with the existing stop-control configuration at Harder/Dollar to calibrate the simulation model to existing conditions. The Harder/Dollar intersection was then modeled as a traffic signal for both Existing and Existing Plus Project conditions to evaluate feasibility. Inputs, assumptions, and evaluation measures are discussed below.

ANALYSIS ASSUMPTIONS

The following assumptions were used to conduct the simulation analysis:

- Signal timing. The Mission/Harder intersection is on a coordinated system (SCATS system) with other signals along Mission Boulevard. The signal at this intersection uses an adaptive signal timing system, with the signal cycle length adjusting as demand changes throughout the day along Mission Boulevard. For the purposes of SimTraffic modeling, two assumptions were made:
 1. The average peak hour cycle length was modeled at Mission/Harder: 139 seconds in the AM peak hour and 150 seconds in the PM peak hour.
 2. The Harder/Dollar intersection was modeled as part of the coordinated system that includes Mission/Harder. The intent of the coordination is to provide eastbound and westbound progression along Harder Road to assist in preventing the potential feasibility concerns described in the previous section.

¹ The existing conditions counts used in the LTA and in this analysis represent counts taken before the COVID-19 pandemic and subsequently adjusted. However, for the calibration, field conditions observed on a typical weekday were calibrated to existing traffic volumes from counts collected on a typical weekday during the COVID-19 pandemic. See Attachment B for the traffic volumes used in calibration.

To build in flexibility for pedestrian accommodation, the modeled signal timing (pedestrian intervals) at Harder/Dollar also included an allowance for a 4-second leading pedestrian interval (LPI) for crossing all four intersection legs.

- Lane configuration. The Existing Plus Project models were updated to include the proposed signal at Harder/Dollar, with a dedicated left-turn lane and a shared right/through lane on the northbound approach (as illustrated in Figure 2 below). The northbound left-turn lane was modeled to be approximately 95 feet in length. The northbound link was modeled as 500 feet to capture queues that may extend beyond a formal approach on the project site; in reality, the project site plan includes approximately 140 feet for formal queueing at the signal approach. The left-turn and through/right lanes would each be 11 feet wide, and the southbound receiving lane would be 13 feet, 9 inches wide. The sidewalks on either side as proposed in the project site plan would be retained as presented in the project site plan (see the LTA).
- No other lane configurations were altered.
- Adjacent intersections: The simulation network was modeled to include the approach roadways extending to the nearest signalized intersections. The simulated vehicles are generated at those locations. In all cases, the signals are sufficiently far such that any vehicle platoons would be relatively dispersed upon arrival. The signal at Harder Road / Jane Avenue was included in the simulation to generate vehicles approaching the primary study intersections. The simulation did not include site access driveways along Mission Boulevard, given that the focus of the analysis was Harder/Dollar.

For all simulations, 10 runs of each peak 1 hour were conducted, and the results were averaged.

MULTIMODAL VOLUMES

The details of multimodal traffic volume collection and adjustments related to the COVID-19 pandemic are included in the LTA. The analysis volumes used for this simulation analysis are presented in Figure 3, Figure 4, Table 1, and Table 2. Existing counts did not include any pedestrian crossings of Harder Road at Dollar Street, in part because there is no marked crossing or control to cross at the intersection. With the proposed project in place and a signalized crossing present, some level of pedestrian activity would be expected. Therefore, pedestrian volumes were adjusted to six crossings in each peak hour at the east and west legs in the signalized scenario as indicated in Tables 1 and 2.

COORDINATION AND TIMING PLANS

Several coordination plans were preliminarily tested to optimize the signal phase sequences between the Harder/Dollar and Mission/Harder intersections. The phase sequencing shown below was selected to minimize the potential for the queuing-related concerns discussed in the *Background and Key Issues* section.

Figure 5: Signal Phasing

FEASIBILITY EVALUATION MEASURES

This section discusses measures used to evaluate the intersection's feasibility:

- Level of service and delay: The vehicle travel delay and LOS for each scenario and peak hour for each was assessed to evaluate the intersections against City LOS standards.
- Queue lengths: The average and 95th percentile queue lengths for each scenario and peak hour were assessed to evaluate the potential for the spill-over effects previously discussed.

Because this analysis is concerned with the Existing Plus Project Conditions (i.e., conditions with the project in place), existing conditions results are not presented in the body of this memorandum. They are included in Attachment A.

Other design tradeoffs not directly measured include pedestrian access, bicyclist safety and comfort, and truck access. They are discussed in the subsequent section, after the discussion of the other performance measures.

FEASIBILITY EVALUATION

LEVEL OF SERVICE AND DELAY

As previously discussed, the simulation was initially calibrated with stop control and existing volumes at Harder/Dollar and then updated to include a signal at the intersection for comparison. The LOS and delay results for Existing Plus Project Conditions both with existing traffic control and with a signal at Harder/Dollar are presented in Table 3. Only the movements most pertinent to the potential effects or with notable changes in average delay are presented; full results are included in Attachment B .

Table 3: Average Control Delay, Existing Plus Project at Harder/Dollar, With and Without Signal

Source: Kittelson & Associates, Inc. 2021

1: LOS per movement only presented for stop-controlled intersections.

2: Overall LOS is typically not reported for stop-control intersections because the worst movement's delay is the relevant measure.

Findings

The operational results include the following findings relevant to the LTA and to overall signal feasibility:

- With signalization, the Harder/Dollar intersection operates at LOS B, within the City's LOS standard. Northbound and southbound drivers have significantly reduced average delay. In the stop-control scenario, the northbound left movement was the worst movement from an average delay standpoint. Delay for that movement is reduced from 168.1 to 47.1 seconds in the AM peak hour and from 95.3 seconds to 45.3 seconds in the PM peak hour. Similar but more modest reductions are realized for southbound drivers.
- At Harder/Dollar, westbound left turning movements incur slightly more average delay with the signal compared to with stop control.
- Delay at Mission/Harder is marginally affected, with similar or slightly lower average delay on the eastbound approach which backs up to Harder/Dollar.

QUEUE LENGTHS

Queue lengths relate most directly to the potential effects of signalization, especially any spillback between the two studied intersections. The average and 95th percentile queue lengths at Harder/Dollar and Mission/Harder are presented in Table 4 and Table 5. Only the movements most pertinent to the potential effects or with notable changes in average delay are presented; full results are included in Attachment .

Note: Red numbers indicate queue lengths extending past available storage.

Findings

The results indicate the following related to the potential effects of signalization:

- Westbound queues at Harder/Dollar would not spill back to Mission/Harder with signalization at Harder/Dollar. Westbound queues at Harder/Dollar were virtually nonexistent with the existing stop control at Harder/Dollar. With the signal installed, they increase in the AM and PM peak periods. However, in both peak periods the left-turn and through movement 95th percentile queues are served by available storage. The longest westbound queue is the 95th percentile through movement in the PM peak period; the 138-foot-long queue represents about half of available storage.
- Eastbound queues at Mission/Harder spill back to Harder/Dollar without signalization at Harder/Dollar and may continue to do so with signalization. The eastbound approach at Mission/Harder experiences relatively long queues due to the long cycle length used by the adaptive system on Mission Boulevard. In the existing stop control configuration, eastbound through/right turn 95th percentile queues spill back to the Harder/Dollar intersection in the AM peak period. The queue reduces slightly in the signalized scenario, but the 95th percentile queue is shown essentially to occupy the full storage length. Because of the proposed signal phasing and the relatively low Dollar Street volumes, these queues did not obstruct other movements (e.g., southbound left turns or eastbound through movements at Harder/Dollar) from being served and clearing the intersection. To avoid queue spillback from resulting in the Harder/Dollar intersection being blocked, it is recommended to install KEEP CLEAR pavement markings within the intersection.
- Northbound and southbound queuing at Harder/Dollar is reduced with signalization at Harder/Dollar. In the AM and PM peak hours, northbound left-turn and through/right queuing is reduced from extending beyond available storage to being served within it. In the PM peak hour, northbound through/right 95th percentile queuing occupies almost the full available storage; any additional queuing would occur within the project site. Table 6 and Table 7 reorganize information already presented to show the comparative average and 95th percentile queue lengths for the site access in Existing and Existing Plus Project conditions.

Table 6: Harder/Dollar Queues, AM Peak Hour

Movement	Storage (ft)	Measure	Queue Lengths by Scenario (ft)		
			Stop Control		Signal Existing + Project
			Existing Conditions	Existing + Project

Table 7: Harder/Dollar Queues, PM Peak Hour

Movement	Storage (ft)	Measure	Queue Lengths by Scenario (ft)		
			Existing Conditions	Stop Control	Signal
NBL	95	Average	55	75	65
		95th Percentile	110	130	117
NBT/R	140	Average	27	104	59
		95th Percentile	59	297	136

Source: Kittelson & Associates, Inc. 2021

Note: Red numbers indicate queue lengths extending past available storage.

Overall, the potential queuing spillover effects contemplated in the introduction to this memo do not impact the feasibility of a signal at Harder/Dollar. Because queue spillback from Mission/Harder to Harder/Dollar is possible, it is recommended to install KEEP CLEAR pavement markings in the intersection.

OTHER CONSIDERATIONS

Pedestrian Access

As noted previously, a traffic signal at Harder/Dollar may benefit pedestrians with respect to safety and access as well. In particular, the following benefits were modeled and are recommended:

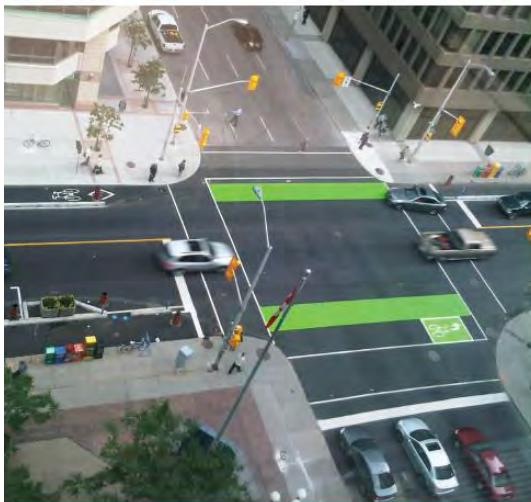

- The signal was modeled to include pedestrian crossings at all four intersection legs and retains the proposed sidewalks on both sides of the project access on the south leg of Dollar Street. The pedestrian crossings would be push-button actuated. It is recommended to install high-visibility continental or ladder-style crosswalks and provide pedestrian phases across all four legs of the intersection. The signals should include pushbutton actuation for pedestrians and accessible pedestrian signals (APS).
- The signal was also modeled with an allowance in the pedestrian intervals to include a 4-second leading pedestrian interval (LPI) on all crossings. It is recommended to include an LPI in the signal timing, which would give pedestrians a head start crossing the intersection.
- The presence of a signal provides for pedestrians an additional crossing of Harder Road, which was identified in the Hayward Bicycle and Pedestrian Master Plan (BPMP) as part of the City's pedestrian high-injury network. The signalized crossing would reduce route circuitry in accessing the project site from the north.

Bicyclist Safety and Comfort

Harder Road includes an on-street bicycle lane (Class II) in both directions. The installation of a signal would not change that but would provide the following opportunities and benefits to people biking:

- Provision for left turns. For people biking to make an eastbound or westbound left-turn under the existing configuration, they need to weave across two lanes of traffic either uphill traveling east or within 200 feet of the Mission/Harder intersection traveling west. To improve accessibility and provide left-turns for bicyclists, the traffic signal is recommended to include two-stage turn boxes for both eastbound and westbound left turns. Pages 25-26 of Appendix D of the BPMP include details and guidance for designing and installing the treatment. See Figure 6 for an example and Item A in Figure 7..
- Separation of eastbound through bicyclists at Harder/Dollar and drivers turning right at Dollar Street or at Harder Road. Traveling eastbound uphill, people biking currently face a possible "right-hook" conflict from drivers turning right onto Dollar Street/project driveway. Similarly, drivers turning right onto Mission Boulevard at the next intersection are required to merge across the bike lane. An advanced stop bar ("bike box") is recommended on the eastbound approach for bicyclists to position themselves in front of (and to the left of) drivers turning right at Dollar Street or Harder Road. The bike box would improve comfort and safety for people biking. Details and design guidance are provided on pages 23-24 of Appendix D to the BPMP. Green "crossbike" markings continuing the bicycle lane through the intersection would clearly delineate space for people biking through the intersection along Harder Road eastbound and westbound. Pages 27-28 of Appendix D to the BPMP include details and design guidance. See Figure 6 for an example and Item B in Figure 7.

Figure 6: Two-stage turn box (left) and bike box (right). Both treatments could provide dedicated space for bicyclists along Harder Road at Harder/Dollar.

Source: NACTO

Truck Access

The LTA discussed truck access to and from the site and notes that large trucks (i.e. AASHTO WB-67 trucks and others longer than 30- or 40-foot-long single unit trucks) can access the site but would over track into opposing lanes both entering and exiting the site. Based on this potential conflict (which is unrelated to the intersection control at Harder/Dollar), the LTA recommends that tenants schedule large truck deliveries to the project site to occur outside of the AM and PM peak hours (7:00-9:00 AM and 4:00-6:00 PM, respectively).

This LTA recommendation has an ancillary benefit related to signal operations. Large trucks would occupy all or almost all of the westbound left-turn storage at Harder/Dollar. Any potential effect on queueing of truck access would be attenuated by recommending their site access to outside the peak hours.

When designing the pavement markings for the intersection, consider pulling back/staggered the left-turn stop bar to allow for truck over tracking.

LIMITATIONS

This analysis documented on this memorandum focused on Existing Plus Project conditions as the pertinent scenario for this analysis. It did not include any future-year (i.e., Cumulative) conditions which have less certain assumptions associated with their development and are appropriate for less detailed analysis. future-year forecast information associated with them and which represent a more distant planning horizon with uncertain information . The discussion and presentation of results considered the operations of the two closely spaced signals (Harder/Dollar and Harder/Mission) with respect to queuing and assumed a fixed cycle length at Mission/Harder. Any queuing between the Harder/Dollar and Harder/Jane intersections is not considered to be impacted by the new signal.

RECOMMENDATIONS

This analysis demonstrated that installation of a traffic signal at Harder/Dollar, as recommended in the LTA, is feasible from an operational standpoint. The following recommendations are proposed to accompany the future signal.

- Include the Harder/Dollar intersection as a secondary intersection to Mission/Harder on the SCATS coordinated signal system. The simulation analysis was predicated on the assumption that the signals could operate on a system together and adapt together (i.e., signal cycles expand and shorten in tandem). This will help to minimize potential for queue spillback between the two intersections.
- Provide a dedicated left-turn lane and a shared right/through lane on the northbound approach at Harder/Dollar. The project proposed site plan can accommodate a 11-foot-wide left-turn lane, an 11-foot-wide through/right turn lane, and a 13-foot, 9-inch-wide southbound receiving lane. Provide sufficient striped storage length to accommodate at least the average northbound left-turn queue in the PM peak period (65 feet) and, if possible, the 95th percentile queue in the PM peak period (117 feet).
- Install KEEP CLEAR pavement markings in the Harder/Dollar intersection.
- Install high-visibility continental or ladder-style crosswalks and provide pedestrian phases across all four legs of the Harder/Dollar intersection. The signals should include pushbutton actuation for pedestrians and APS.

- It is recommended to include a four-second LPI in the signal timing for all four pedestrian phases, which would give pedestrians a head start crossing the intersection.
- To improve accessibility and provide left-turns for bicyclists, stripe two-stage turn boxes for both eastbound and westbound left turns. Pages 25-26 of Appendix D of the BPMP include details and guidance for designing and installing the treatment. See Item A in Figure 7.
- Install an advanced stop bar ("bike box") on the eastbound approach to Harder/Dollar for bicyclists to position themselves in front of (and to the left of) drivers turning right at Dollar Street or Harder Road. The bike box would improve comfort and safety for people biking. Details and design guidance are provided on pages 23-24 of Appendix D to the BPMP. See item B in Figure 7.
- Provide green skip-striping to continue the bicycle lane and clearly delineate space for people biking through the intersection along Harder Road eastbound and westbound. Pages 27-28 of Appendix D to the BPMP include details and design guidance.
- When designing the pavement markings for the intersection, consider pulling back/staggered the left-turn stop bar to allow for truck over tracking. See Item C in Figure 7.
